HP Inc

2024 CDP Corporate Questionnaire 2024

Word version

Important: this export excludes unanswered questions
This document is an export of your organization’s CDP questionnaire response. It contains all data points for questions that are answered or in progress. There may be questions or data points that you have been requested to provide, which are missing from this document because they are currently unanswered. Please note that it is your responsibility to verify that your questionnaire response is complete prior to submission. CDP will not be liable for any failure to do so.

Contents

C1. Introduction 8

(1.1) In which language are you submitting your response? 8

(1.2) Select the currency used for all financial information disclosed throughout your response. 8

(1.3) Provide an overview and introduction to your organization. 8

(1.4) State the end date of the year for which you are reporting data. For emissions data, indicate whether you will be providing emissions data for past reporting years 9

(1.4.1) What is your organization's annual revenue for the reporting period? 9

(1.5) Provide details on your reporting boundary. 9

(1.6) Does your organization have an ISIN code or another unique identifier (e.g., Ticker, CUSIP, etc.)? 9

(1.7) Select the countries/areas in which you operate. 11

(1.8) Are you able to provide geolocation data for your facilities? 12

(1.8.1) Please provide all available geolocation data for your facilities. 13

(1.24) Has your organization mapped its value chain? 18

C2. Identification, assessment, and management of dependencies, impacts, risks, and opportunities 20

(2.1) How does your organization define short-, medium-, and long-term time horizons in relation to the identification, assessment, and management of your environmental dependencies, impacts, risks, and opportunities? 20

(2.2) Does your organization have a process for identifying, assessing, and managing environmental dependencies and/or impacts? 21

(2.2.1) Does your organization have a process for identifying, assessing, and managing environmental risks and/or opportunities? 22

(2.2.2) Provide details of your organization's process for identifying, assessing, and managing environmental dependencies, impacts, risks, and/or opportunities. 22

(2.2.7) Are the interconnections between environmental dependencies, impacts, risks and/or opportunities assessed? 26

(2.3) Have you identified priority locations across your value chain? 27

(2.4) How does your organization define substantive effects on your organization? 28

(2.5) Does your organization identify and classify potential water pollutants associated with its activities that could have a detrimental impact on water ecosystems or human health? 31

(2.5.1) Describe how your organization minimizes the adverse impacts of potential water pollutants on water ecosystems or human health associated with your activities. 31

C3. Disclosure of risks and opportunities 36

(3.1) Have you identified any environmental risks which have had a substantive effect on your organization in the reporting year, or are anticipated to have a substantive effect on your organization in the future? 36

(3.1.1) Provide details of the environmental risks identified which have had a substantive effect on your organization in the reporting year, or are anticipated to have a substantive effect on your organization in the future. 36

(3.2) Within each river basin, how many facilities are exposed to substantive effects of water-related risks, and what percentage of your total number of facilities does this represent? 43

(3.3) In the reporting year, was your organization subject to any fines, enforcement orders, and/or other penalties for water-related regulatory violations? 45

(3.5) Are any of your operations or activities regulated by a carbon pricing system (i.e. ETS, Cap & Trade or Carbon Tax)? 45

(3.5.4) What is your strategy for complying with the systems you are regulated by or anticipate being regulated by? 45

(3.6) Have you identified any environmental opportunities which have had a substantive effect on your organization in the reporting year, or are anticipated to have a substantive effect on your organization in the future? 45

(3.6.1) Provide details of the environmental opportunities identified which have had a substantive effect on your organization in the reporting year, or are anticipated to have a substantive effect on your organization in the future. 46

C4. Governance 53

(4.1) Does your organization have a board of directors or an equivalent governing body? 53

(4.1.1) Is there board-level oversight of environmental issues within your organization? 54

(4.1.2) Identify the positions (do not include any names) of the individuals or committees on the board with accountability for environmental issues and provide details of the board's oversight of environmental issues. 54

(4.2) Does your organization's board have competency on environmental issues? 57

(4.3) Is there management-level responsibility for environmental issues within your organization? 58

(4.3.1) Provide the highest senior management-level positions or committees with responsibility for environmental issues (do not include the names of individuals). 58

(4.5) Do you provide monetary incentives for the management of environmental issues, including the attainment of targets? 61

(4.5.1) Provide further details on the monetary incentives provided for the management of environmental issues (do not include the names of individuals). 62

(4.6) Does your organization have an environmental policy that addresses environmental issues? 66

(4.6.1) Provide details of your environmental policies. 67

(4.10) Are you a signatory or member of any environmental collaborative frameworks or initiatives? 75

(4.11) In the reporting year, did your organization engage in activities that could directly or indirectly influence policy, law, or regulation that may (positively or negatively) impact the environment? 76

(4.11.1) On what policies, laws, or regulations that may (positively or negatively) impact the environment has your organization been engaging directly with policy makers in the reporting year? 77

(4.11.2) Provide details of your indirect engagement on policy, law, or regulation that may (positively or negatively) impact the environment through trade associations or other intermediary organizations or individuals in the reporting year. 83

(4.12) Have you published information about your organization's response to environmental issues for this reporting year in places other than your CDP response? 87

(4.12.1) Provide details on the information published about your organization's response to environmental issues for this reporting year in places other than your CDP response. Please attach the publication. 87

C5. Business strategy 91

(5.1) Does your organization use scenario analysis to identify environmental outcomes? 91

(5.1.1) Provide details of the scenarios used in your organization's scenario analysis. 91

(5.1.2) Provide details of the outcomes of your organization's scenario analysis. 99

(5.2) Does your organization's strategy include a climate transition plan? 102

(5.3) Have environmental risks and opportunities affected your strategy and/or financial planning? 104

(5.3.1) Describe where and how environmental risks and opportunities have affected your strategy. 104

(5.3.2) Describe where and how environmental risks and opportunities have affected your financial planning. 106

(5.4) In your organization's financial accounting, do you identify spending/revenue that is aligned with your organization's climate transition? 107

(5.4.1) Quantify the amount and percentage share of your spending/revenue that is aligned with your organization's climate transition. 107

(5.9) What is the trend in your organization's water-related capital expenditure (CAPEX) and operating expenditure (OPEX) for the reporting year, and the anticipated trend for the next reporting year? 109

(5.10) Does your organization use an internal price on environmental externalities? 110

(5.11) Do you engage with your value chain on environmental issues? 110

(5.11.1) Does your organization assess and classify suppliers according to their dependencies and/or impacts on the environment? 112

(5.11.2) Does your organization prioritize which suppliers to engage with on environmental issues? 114

(5.11.5) Do your suppliers have to meet environmental requirements as part of your organization's purchasing process? 115

(5.11.6) Provide details of the environmental requirements that suppliers have to meet as part of your organization's purchasing process, and the compliance measures in place. 116

(5.11.7) Provide further details of your organization's supplier engagement on environmental issues. 121

(5.11.9) Provide details of any environmental engagement activity with other stakeholders in the value chain. 125

C6. Environmental Performance - Consolidation Approach 129

(6.1) Provide details on your chosen consolidation approach for the calculation of environmental performance data. 129

C7. Environmental performance - Climate Change 130

(7.1) Is this your first year of reporting emissions data to CDP? 130

(7.1.1) Has your organization undergone any structural changes in the reporting year, or are any previous structural changes being accounted for in this disclosure of emissions data? 130

(7.1.2) Has your emissions accounting methodology, boundary, and/or reporting year definition changed in the reporting year? 130

(7.1.3) Have your organization’s base year emissions and past years’ emissions been recalculated as a result of any changes or errors reported in 7.1.1 and/or 7.1.2?.... 131

(7.2) Select the name of the standard, protocol, or methodology you have used to collect activity data and calculate emissions. 132

(7.3) Describe your organization’s approach to reporting Scope 2 emissions. 132

(7.4) Are there any sources (e.g. facilities, specific GHGs, activities, geographies, etc.) of Scope 1, Scope 2 or Scope 3 emissions that are within your selected reporting boundary which are not included in your disclosure? 133

(7.5) Provide your base year and base year emissions. 133

(7.6) What were your organization’s gross global Scope 1 emissions in metric tons CO2e? 143

(7.7) What were your organization’s gross global Scope 2 emissions in metric tons CO2e? 144

(7.8) Account for your organization’s gross global Scope 3 emissions, disclosing and explaining any exclusions. 144

(7.9) Indicate the verification/assurance status that applies to your reported emissions. 156

(7.9.1) Provide further details of the verification/assurance undertaken for your Scope 1 emissions, and attach the relevant statements. 157

(7.9.2) Provide further details of the verification/assurance undertaken for your Scope 2 emissions and attach the relevant statements. 158

(7.9.3) Provide further details of the verification/assurance undertaken for your Scope 3 emissions and attach the relevant statements. 160

(7.10) How do your gross global emissions (Scope 1 and 2 combined) for the reporting year compare to those of the previous reporting year? 162

(7.10.1) Identify the reasons for any change in your gross global emissions (Scope 1 and 2 combined), and for each of them specify how your emissions compare to the previous year. 162

(7.10.2) Are your emissions performance calculations in 7.10 and 7.10.1 based on a location-based Scope 2 emissions figure or a market-based Scope 2 emissions figure? 168

(7.12) Are carbon dioxide emissions from biogenic carbon relevant to your organization? 169

(7.12.1) Provide the emissions from biogenic carbon relevant to your organization in metric tons CO2. 169

(7.15) Does your organization break down its Scope 1 emissions by greenhouse gas type? 169

(7.15.1) Break down your total gross global Scope 1 emissions by greenhouse gas type and provide the source of each used global warming potential (GWP). 169

(7.16) Break down your total gross global Scope 1 and 2 emissions by country/area. 172

(7.17) Indicate which gross global Scope 1 emissions breakdowns you are able to provide. 194

(7.17.1) Break down your total gross global Scope 1 emissions by business division. 194

(7.20) Indicate which gross global Scope 2 emissions breakdowns you are able to provide. 195
(7.20.1) Break down your total gross global Scope 2 emissions by business division. 195
(7.22) Break down your gross Scope 1 and Scope 2 emissions between your consolidated accounting group and other entities included in your response. 195
(7.23) Is your organization able to break down your emissions data for any of the subsidiaries included in your CDP response? 197
(7.26) Allocate your emissions to your customers listed below according to the goods or services you have sold them in this reporting period. 1
(7.27) What are the challenges in allocating emissions to different customers, and what would help you to overcome these challenges? 1
(7.28) Do you plan to develop your capabilities to allocate emissions to your customers in the future? 1
(7.29) What percentage of your total operational spend in the reporting year was on energy? 197
(7.30) Select which energy-related activities your organization has undertaken. 197
(7.30.1) Report your organization’s energy consumption totals (excluding feedstocks) in MWh. 198
(7.30.6) Select the applications of your organization’s consumption of fuel. 200
(7.30.7) State how much fuel in MWh your organization has consumed (excluding feedstocks) by fuel type. 201
(7.30.9) Provide details on the electricity, heat, steam, and cooling your organization has generated and consumed in the reporting year. 206
(7.30.16) Provide a breakdown by country/area of your electricity/heat/steam/cooling consumption in the reporting year. 208
(7.30.17) Provide details of your organization’s renewable electricity purchases in the reporting year by country/area. 257
(7.30.18) Provide details of your organization’s low-carbon heat, steam, and cooling purchases in the reporting year by country/area. 324
(7.30.19) Provide details of your organization’s renewable electricity generation by country/area in the reporting year. 324
(7.30.20) Describe how your organization’s renewable electricity sourcing strategy directly or indirectly contributes to bringing new capacity into the grid in the countries/areas in which you operate. 327
(7.30.21) In the reporting year, has your organization faced barriers or challenges to sourcing renewable electricity? 327
(7.30.22) Provide details of the country/area-specific challenges to sourcing renewable electricity faced by your organization in the reporting year. 328
(7.45) Describe your gross global combined Scope 1 and 2 emissions for the reporting year in metric tons CO2e per unit currency total revenue and provide any additional intensity metrics that are appropriate to your business operations. 330
(7.52) Provide any additional climate-related metrics relevant to your business. 333
(7.53) Did you have an emissions target that was active in the reporting year? 334
(7.53.1) Provide details of your absolute emissions targets and progress made against those targets. 334
(7.53.2) Provide details of your emissions intensity targets and progress made against those targets. 366
(7.54) Did you have any other climate-related targets that were active in the reporting year? 370
(7.54.1) Provide details of your targets to increase or maintain low-carbon energy consumption or production. 370

(7.54.2) Provide details of any other climate-related targets, including methane reduction targets. 373
(7.54.3) Provide details of your net-zero target(s). 380
(7.55) Did you have emissions reduction initiatives that were active within the reporting year? Note that this can include those in the planning and/or implementation phases. 383
(7.55.1) Identify the total number of initiatives at each stage of development, and for those in the implementation stages, the estimated CO2e savings. 383
(7.55.2) Provide details on the initiatives implemented in the reporting year in the table below. 383
(7.55.3) What methods do you use to drive investment in emissions reduction activities? 387
(7.73) Are you providing product level data for your organization's goods or services? 389
(7.73.1) Give the overall percentage of total emissions, for all Scopes, that are covered by these products. 389
(7.73.2) Complete the following table for the goods/services for which you want to provide data. 390
(7.73.3) Complete the following table with data for lifecycle stages of your goods and/or services. 396
(7.73.4) Please detail emissions reduction initiatives completed or planned for this product. 447
(7.73.5) Have any of the initiatives described in 7.73.4 been driven by requesting CDP Supply Chain members? 447
(7.74) Do you classify any of your existing goods and/or services as low-carbon products? 447
(7.74.1) Provide details of your products and/or services that you classify as low-carbon products. 448
(7.79) Has your organization canceled any project-based carbon credits within the reporting year? 450

C9. Environmental performance - Water security 451
(9.1) Are there any exclusions from your disclosure of water-related data? 451
(9.1.1) Provide details on these exclusions. 451
(9.2) Across all your operations, what proportion of the following water aspects are regularly measured and monitored? 452
(9.2.2) What are the total volumes of water withdrawn, discharged, and consumed across all your operations, how do they compare to the previous reporting year, and how are they forecasted to change? 460
(9.2.4) Indicate whether water is withdrawn from areas with water stress, provide the volume, how it compares with the previous reporting year, and how it is forecasted to change. 463
(9.2.7) Provide total water withdrawal data by source. 464
(9.2.8) Provide total water discharge data by destination. 468
(9.2.9) Within your direct operations, indicate the highest level(s) to which you treat your discharge. 470
(9.2.10) Provide details of your organization's emissions of nitrates, phosphates, pesticides, and other priority substances to water in the reporting year. 475

(9.3) In your direct operations and upstream value chain, what is the number of facilities where you have identified substantive water-related dependencies, impacts, risks, and opportunities? 476

(9.3.1) For each facility referenced in 9.3, provide coordinates, water accounting data, and a comparison with the previous reporting year. 477

(9.3.2) For the facilities in your direct operations referenced in 9.3.1, what proportion of water accounting data has been third party verified? 484

(9.4) Could any of your facilities reported in 9.3.1 have an impact on a requesting CDP supply chain member? 487

(9.5) Provide a figure for your organization's total water withdrawal efficiency. 487

(9.13) Do any of your products contain substances classified as hazardous by a regulatory authority? 488

(9.13.1) What percentage of your company's revenue is associated with products containing substances classified as hazardous by a regulatory authority? 488

(9.14) Do you classify any of your current products and/or services as low water impact? 489

(9.15) Do you have any water-related targets? 489

(9.15.1) Indicate whether you have targets relating to water pollution, water withdrawals, WASH, or other water-related categories. 490

(9.15.2) Provide details of your water-related targets and the progress made. 490

C13. Further information & sign off 493

(13.1) Indicate if any environmental information included in your CDP response (not already reported in 7.9.1/2/3, 8.9.1/2/3/4, and 9.3.2) is verified and/or assured by a third party? 493

(13.1.1) Which data points within your CDP response are verified and/or assured by a third party, and which standards were used? 493

(13.3) Provide the following information for the person that has signed off (approved) your CDP response. 495

(13.4) Please indicate your consent for CDP to share contact details with the Pacific Institute to support content for its Water Action Hub website. 495

C1. Introduction

(1.1) In which language are you submitting your response?

Select from:

☑ English

(1.2) Select the currency used for all financial information disclosed throughout your response.

Select from:

☑ USD

(1.3) Provide an overview and introduction to your organization.

(1.3.2) Organization type

Select from:

☑ Publicly traded organization

(1.3.3) Description of organization

The information presented throughout this response is representative of HP Inc. ("HP"; NYSE: HPQ) as it operated in fiscal year 2023 (November 1, 2022 through October 31, 2023) unless otherwise stated. For HP's CDP responses for our fiscal year 2015 and prior, please see responses from Hewlett Packard Company. On November 1, 2015, we completed the separation of Hewlett Packard Enterprise Company ("Hewlett Packard Enterprise"; NYSE: HPE), Hewlett-Packard Company's former enterprise technology infrastructure, software, services, and financing businesses. In connection with the separation, Hewlett-Packard Company changed its name to HP Inc. ("HP"). HP is a leading global provider of personal computing and other access devices, imaging and printing products, and related technologies, solutions, and services. We sell to individual consumers, small and medium-sized businesses, and large enterprises, including customers in the government, health, and education sectors. Founded in 1939 and incorporated in 1947, HP is a company with a strong legacy in global citizenship and sustainability. Setting bold, long-term goals for HP strategy focuses on the issues where we can have the greatest impact: climate action, human rights and digital equity. We recognize and embrace the opportunity and responsibility to address some of the greatest shared challenges facing society today, including resource scarcity, climate change, the shift to cleaner energy, access to quality education and economic opportunity, human rights protection throughout the supply chain, and data security and privacy. HP's commitment to environmental sustainability and energy efficiency spans our entire business—from how we make our products, empower our customers, and manage our supply chain to how we run our operations, develop partnerships, and engage in public policy. HP is reinventing how products are designed, manufactured, used, and recovered as we shift our business model and operations toward a circular and net zero carbon economy. Working with our supply chain partners and others, we are reducing the environmental impact of our products and services at every stage of the value chain.

[Fixed row]

(1.4) State the end date of the year for which you are reporting data. For emissions data, indicate whether you will be providing emissions data for past reporting years.

	End date of reporting year	**Alignment of this reporting period with your financial reporting period**	**Indicate if you are providing emissions data for past reporting years**
	10/31/2023	*Select from:* ☑ Yes	*Select from:* ☑ No

[Fixed row]

(1.4.1) What is your organization's annual revenue for the reporting period?

53718000000

(1.5) Provide details on your reporting boundary.

	Is your reporting boundary for your CDP disclosure the same as that used in your financial statements?	**How does your reporting boundary differ to that used in your financial statement?**
	Select from: ☑ No	*ESG metrics in this report do not include Apogee and Simpress, independent subsidiaries of HP, unless otherwise stated.*

[Fixed row]

(1.6) Does your organization have an ISIN code or another unique identifier (e.g., Ticker, CUSIP, etc.)?

ISIN code - bond

(1.6.1) Does your organization use this unique identifier?

Select from:

☑ No

ISIN code - equity

(1.6.1) Does your organization use this unique identifier?

Select from:

☑ No

CUSIP number

(1.6.1) Does your organization use this unique identifier?

Select from:

☑ No

Ticker symbol

(1.6.1) Does your organization use this unique identifier?

Select from:

☑ Yes

(1.6.2) Provide your unique identifier

NYSE: HPQ

SEDOL code

(1.6.1) Does your organization use this unique identifier?

Select from:
☑ No

LEI number

(1.6.1) Does your organization use this unique identifier?

Select from:
☑ No

D-U-N-S number

(1.6.1) Does your organization use this unique identifier?

Select from:
☑ No

Other unique identifier

(1.6.1) Does your organization use this unique identifier?

Select from:
☑ No
[Add row]

(1.7) Select the countries/areas in which you operate.

Select all that apply
☑ Peru
☑ Chile
☑ China
☑ Japan
☑ Spain
☑ Brazil

☑ India
☑ Italy
☑ Greece
☑ Israel
☑ Mexico
☑ Norway
☑ Poland
☑ Croatia
☑ Czechia
☑ Denmark
☑ Finland
☑ Germany
☑ Bulgaria
☑ Colombia
☑ Malaysia
☑ Portugal
☑ Slovakia
☑ Singapore

(1.24) Has your organization mapped its value chain?

(1.24.1) Value chain mapped

Select from:

☑ Yes, we have mapped or are currently in the process of mapping our value chain

(1.24.2) Value chain stages covered in mapping

Select all that apply

☑ Upstream value chain

(1.24.3) Highest supplier tier mapped

Select from:

☑ Tier 2 suppliers

(1.24.4) Highest supplier tier known but not mapped

Select from:

☑ Tier 3 suppliers

(1.24.7) Description of mapping process and coverage

Supplier Mapping Process and Coverage at HP: HP maps its suppliers from tier 1, including finished product suppliers, final assembly partners, and component/parts/materials suppliers (note that ‘tier’ here is in terms of procurement relationships, which includes suppliers beyond tier 1 in terms of material/production flow). Mapping Scope: HP's formal supplier mapping procedures are designed to provide visibility up to tier 2 suppliers. This scope includes direct suppliers (tier 1) and their direct suppliers (tier 2), allowing HP to monitor a significant portion of its supply chain. Mapping for Minerals (Tin, Tantalum, Tungsten, and Gold – 3TG): HP sets clear requirements of 3TG suppliers in our Supply Chain Social and Environmental Responsibility. To identify the smelters and refiners in our supply chain, between January and December 2023 HP surveyed suppliers that contributed material, components, or manufacturing for products containing 3TG through the Responsible Minerals Initiative's Conflict Minerals Reporting Template (RMI CMRT), giving companies a common format for sharing information about 3TG sources with business partners and suppliers across the supply chain. In 2023, we received RMI CMRT from 100% of in-scope suppliers (which includes final assembly and commodity suppliers of products and components containing 3TG).
[Fixed row]

C2. Identification, assessment, and management of dependencies, impacts, risks, and opportunities

(2.1) How does your organization define short-, medium-, and long-term time horizons in relation to the identification, assessment, and management of your environmental dependencies, impacts, risks, and opportunities?

Short-term

(2.1.1) From (years)

0

(2.1.3) To (years)

1

(2.1.4) How this time horizon is linked to strategic and/or financial planning

This is the time horizon for identifying and assessing the most immediate and urgent risks that affect our operations, products, and services. We also prioritize the risks and opportunities that can enhance our competitive advantage, reputation, and stakeholder relations in the short-term.

Medium-term

(2.1.1) From (years)

1

(2.1.3) To (years)

5

(2.1.4) How this time horizon is linked to strategic and/or financial planning

This is the time horizon for assessing risks that are likely to emerge or change in the medium term, and that may require adjustments in our strategies, policies and practices. We also evaluate the environmental risks and opportunities that can support our innovation, growth and resilience in the medium term. These inputs are incorporated in functional financial planning process, and drive our strategic investments to mitigate risks and/or drive innovation and growth.

Long-term

(2.1.1) From (years)

5

(2.1.2) Is your long-term time horizon open ended?

Select from:

☑ Yes

(2.1.4) How this time horizon is linked to strategic and/or financial planning

This is the time horizon for identifying and assessing the key risks driven by long-term trends, scenarios, and uncertainties, and that may pose significant challenges or opportunities for our organization in the future. We also explore the environmental risks and opportunities that can shape our vision, mission, and values in the long-term.
[Fixed row]

(2.2) Does your organization have a process for identifying, assessing, and managing environmental dependencies and/or impacts?

	Process in place	**Dependencies and/or impacts evaluated in this process**
	Select from: ☑ Yes	*Select from:* ☑ Both dependencies and impacts

[Fixed row]

(2.2.1) Does your organization have a process for identifying, assessing, and managing environmental risks and/or opportunities?

	Process in place	Risks and/or opportunities evaluated in this process	Is this process informed by the dependencies and/or impacts process?
	Select from: ☑ Yes	*Select from:* ☑ Both risks and opportunities	*Select from:* ☑ Yes

[Fixed row]

(2.2.2) Provide details of your organization's process for identifying, assessing, and managing environmental dependencies, impacts, risks, and/or opportunities.

Row 1

(2.2.2.1) Environmental issue

Select all that apply

☑ Climate change

☑ Water

(2.2.2.2) Indicate which of dependencies, impacts, risks, and opportunities are covered by the process for this environmental issue

Select all that apply

☑ Risks

☑ Opportunities

(2.2.2.3) Value chain stages covered

Select all that apply

☑ Direct operations

☑ Upstream value chain

☑ Downstream value chain

(2.2.2.4) Coverage

Select from:

☑ Full

(2.2.2.5) Supplier tiers covered

Select all that apply

☑ Tier 1 suppliers

☑ Tier 2 suppliers

(2.2.2.7) Type of assessment

Select from:

☑ Qualitative and quantitative

(2.2.2.8) Frequency of assessment

Select from:

☑ Every two years

(2.2.2.9) Time horizons covered

Select all that apply

☑ Short-term

☑ Medium-term

☑ Long-term

(2.2.2.10) Integration of risk management process

Select from:

☑ Integrated into multi-disciplinary organization-wide risk management process

(2.2.2.11) Location-specificity used

Select all that apply

☑ Site-specific

☑ Not location specific

(2.2.2.12) Tools and methods used

Commercially/publicly available tools

☑ WRI Aqueduct

Enterprise Risk Management

☑ Enterprise Risk Management

Other

☑ External consultants

☑ Materiality assessment

☑ Partner and stakeholder consultation/analysis

☑ Scenario analysis

(2.2.2.13) Risk types and criteria considered

Acute physical

☑ Cyclones, hurricanes, typhoons

☑ Flood (coastal, fluvial, pluvial, ground water)

☑ Heavy precipitation (rain, hail, snow/ice)

☑ Wildfires

Chronic physical

☑ Heat stress

☑ Water availability at a basin/catchment level

☑ Water stress
☑ Sea level rise
☑ Change in land-use
☑ Temperature variability

Policy
☑ Carbon pricing mechanisms
☑ Poor enforcement of environmental regulation

Market
☑ Availability and/or increased cost of certified sustainable material

Reputation
☑ Negative press coverage related to support of projects or activities with negative impacts on the environment (e.g. GHG emissions, deforestation & conversion, water stress)

Technology
☑ Other technology, please specify :Transition to increasing renewable content

Liability
☑ Non-compliance with regulations

(2.2.2.14) Partners and stakeholders considered

Select all that apply
☑ NGOs
☑ Customers
☑ Employees
☑ Investors
☑ Suppliers
☑ Regulators

(2.2.2.15) Has this process changed since the previous reporting year?

Select from:

☑ No

(2.2.2.16) Further details of process

HP's Enterprise Risk Management (ERM) function within its Internal Audit organization evaluates risks at the enterprise, business, and functional levels, including climate-related risks. These risks are integrated into the primary categories of operations and environmental sustainability. The ERM process, led by the Director of Enterprise Risk Management and supported by HP's top executives, includes an annual risk survey and collaboration with internal teams such as Internal Audit, Ethics and Compliance, and Global Resiliency. If specific risks exceed established thresholds, they are escalated for review and potential mitigation. HP's most acute climate-related risks involve adverse weather and natural disasters, which are monitored by Supply Chain Operations as part of Business Continuity Management (BCM). The BCM program, supported by Everstream Analytics, tracks real-time risk incidents across thousands of suppliers and sites, covering hazards like flooding, drought, and wildfires. This monitoring enables HP to activate resilience plans at the facility level, minimizing operational disruptions. HP’s Global Risk Management (GRM) complements BCM by protecting against financial impacts from casualty losses. GRM engages risk engineering firms to inspect major sites, assess risks like wind, flood, and fire, and estimate potential losses. This information supports the underwriting of insurance policies that safeguard HP's assets and economic stability. The Climate Action Team within HP's Sustainability, Impact, and Compliance (SI&C) organization is responsible for analyzing long-term climate-related risks and opportunities. Since 2019, the team has conducted scenario analyses with third-party consultants, evaluating physical and transition risks under various climate scenarios. The 2023 assessment deepened the analysis of transition risks, such as carbon pricing and shifts in demand toward low-carbon products, using the latest climate models to understand potential financial impacts. This analysis guides further risk management efforts, stakeholder engagement, and data collection. We use the WRI’s Aqueduct Water Risk Atlas tool to assess the risk of sites and prioritize reductions in water-stressed locations. Using this tool, we assessed 216 HP facilities as part of our risk modeling for 2023. Ninety-eight of the facilities assessed (46% of the total) fall within the high or extremely high categories for baseline water stress.

[Add row]

(2.2.7) Are the interconnections between environmental dependencies, impacts, risks and/or opportunities assessed?

(2.2.7.1) Interconnections between environmental dependencies, impacts, risks and/or opportunities assessed

Select from:

☑ No

(2.2.7.3) Primary reason for not assessing interconnections between environmental dependencies, impacts, risks and/or opportunities

Select from:

☑ No standardized procedure

(2.2.7.4) Explain why you do not assess the interconnections between environmental dependencies, impacts, risks and/or opportunities

The environmental risks identified are distinct, either to particular sites and/or topics (eg, low carbon products). The focus currently is to assess and address the specific risks identified. There is also no standard procedure to conduct this interconnections assessment.
[Fixed row]

(2.3) Have you identified priority locations across your value chain?

(2.3.1) Identification of priority locations

Select from:

☑ Yes, we have identified priority locations

(2.3.2) Value chain stages where priority locations have been identified

Select all that apply

☑ Direct operations

☑ Upstream value chain

(2.3.3) Types of priority locations identified

Sensitive locations

☑ Areas of limited water availability, flooding, and/or poor quality of water

Locations with substantive dependencies, impacts, risks, and/or opportunities

☑ Locations with substantive dependencies, impacts, risks, and/or opportunities relating to water

(2.3.4) Description of process to identify priority locations

Water: For both HP's operations and supply chain, we conduct water risk assessment to identify priority sites in areas of limited water availability, flooding, and/or poor water quality using WRI's Aqueduct Water Risk Atlas tool. Sites are assessed using coordinates and results are produced at the river basin level. Indicators used are overall water risk (scarcity and physical risk) as well as baseline water stress. Using this tool, we assessed 216 HP facilities as part of our risk modeling for 2023, as well as supplier sites representing 95% of our direct production spend. Sites/locations identified correspond to identified priority locations where water risk *results rated high or extreme. Climate: Reducing global emissions is critical to reducing physical climate risks. At the corporate level, this takes place through HP's carbon reductions goals described above. For nearer term physical risks, HP's Supply Chain Operations team uses Everstream Analytics (EA, formerly known as R360) to provide real-time monitoring of numerous categories of risk incidents, including weather and natural disasters, across thousands of supplier, operations, and logistics sites. The weather and natural disaster categories include the principal climate-related physical hazards of flooding, drought, extreme cold, water stress, wildfire, cyclones, as well as other potentially impactful weather-related events. Depending on the event, resilience plans at the facility level are activated in order to minimize potential disruptions to HP's operations and supply chain. Complementing the Supply Chain Operations Team work is HP's Global Risk Management function, which is responsible for protecting HP against monetary impacts from casualty. GRM engages the risk engineering firm GRC to perform site inspections on many of HP's larger sites and facilities, including non-owned/leased sites relative to its logistics processes. GRC performs a multi-faceted examination of the facilities looking at passive, protection, human element, natural hazard and response planning risks. Natural hazard risks include the perils of wind, flood and fire. This examination also includes estimation of maximum foreseeable losses arising from such risks. GRM also engages Technology Risk Consultants to assist in the preparation and quantification of site values, business income, inventory and property at risk. This consultant also assists in evaluating the contingent risk related to key suppliers and their impact to HP should they have a loss. Resiliency and redundancy plans of these suppliers are considered. All of this analysis underwrites insurance policies that protect against loss of or destruction of assets, and economic loss.*

(2.3.5) Will you be disclosing a list/spatial map of priority locations?

Select from:

☑ No, we have a list/geospatial map of priority locations, but we will not be disclosing it

[Fixed row]

(2.4) How does your organization define substantive effects on your organization?

Risks

(2.4.1) Type of definition

Select all that apply

☑ Qualitative

☑ Quantitative

(2.4.2) Indicator used to define substantive effect

Select from:

☑ Other, please specify :Operating profit

(2.4.3) Change to indicator

Select from:

☑ % decrease

(2.4.4) % change to indicator

Select from:

☑ 1-10

(2.4.6) Metrics considered in definition

Select all that apply

☑ Time horizon over which the effect occurs

☑ Likelihood of effect occurring

(2.4.7) Application of definition

Definition and quantifiable indicators: Our current working definition of substantive financial impact for climate-related risks aligns with our enterprise risk management (ERM) principles. The ERM process ensures a consistent risk framework that supports the Board and executive leadership in their risk management governance and oversight role through regular and systematic identification and ownership of significant enterprise risks, assessments that measures the probability, magnitude, and velocity of onset of each risk, and regular reporting and monitoring of program results. If specific risks exceed thresholds for substantive impact, those risks are elevated through the ERM process for review and possible mitigation. We define substantive impact as being roughly equal to 5% of the prior year's operating profit, when such impact is measurable and can be quantified. This definition of substantive financial impact includes climate-related risks. Sustainability risks from HP's ERM Risk Register include risks to HP's operations, products, and supply chain as a result of: climate-related physical, regulatory and reputational risk exposures, market access issues related to product material or energy efficiency standards, product takeback and recycling issues, and resource costs, quality, and scarcity of energy, materials, and water.

Opportunities

(2.4.1) Type of definition

Select all that apply

☑ Qualitative

☑ Quantitative

(2.4.2) Indicator used to define substantive effect

Select from:

☑ Other, please specify :Operating profit

(2.4.3) Change to indicator

Select from:

☑ % increase

(2.4.4) % change to indicator

Select from:

☑ 1-10

(2.4.6) Metrics considered in definition

Select all that apply

☑ Time horizon over which the effect occurs

☑ Likelihood of effect occurring

(2.4.7) Application of definition

Definition and quantifiable indicators: Our current working definition of substantive financial impact for climate-related risks aligns with our enterprise risk management (ERM) principles. The ERM process ensures a consistent risk framework that supports the Board and executive leadership in their risk management governance and oversight role through regular and systematic identification and ownership of significant enterprise risks, assessments that measures the probability, magnitude, and velocity of onset of each risk, and regular reporting and monitoring of program results. If specific risks exceed thresholds for substantive impact, those risks are elevated through the ERM process for review and possible mitigation. We define substantive impact as being roughly equal to 5% of the prior year's operating profit, when such impact is measurable and can be quantified. This definition of substantive financial impact includes climate-related risks. Sustainability risks from HP's ERM Risk Register include risks to HP's operations, products, and supply chain as a result of: climate-related physical, regulatory and reputational risk exposures, market access issues related to product material or energy efficiency standards, product takeback and recycling issues, and resource costs, quality, and scarcity of energy, materials, and water. We use this same threshold for opportunities as is described for risks above, but opportunities would be identified with a % increase instead of a % decrease in operating profit. Therefore, opportunities with substantive impact are those with the potential to cause a 5% increase of the prior year's operating profit.

[Add row]

(2.5) Does your organization identify and classify potential water pollutants associated with its activities that could have a detrimental impact on water ecosystems or human health?

(2.5.1) Identification and classification of potential water pollutants

Select from:

☑ Yes, we identify and classify our potential water pollutants

(2.5.2) How potential water pollutants are identified and classified

i) Details of the policies and processes your organization has in place to identify and classify potential water pollutants: HP identifies and classifies potential water pollutants in accordance with local monitoring requirements at all sites. ii) A description of the metrics and/or indicators used to identify pollutants: For example, at our Malaysia facility, we must comply with Standard B local regulations, which requires that we monitor and treat 31 parameters that have the potential to be detrimental to human health or the environment. We use laboratory testing as required to identify and treat these potential water pollutants in our wastewater. ii) Details of an established standard followed by the company: We follow this same procedure at all sites where requirements to monitor for potential water pollutants exist. As outlined in our EHS standards for Air and Water, HP is committed to meeting or exceeding all applicable legal requirements, local codes, and regulations.
[Fixed row]

(2.5.1) Describe how your organization minimizes the adverse impacts of potential water pollutants on water ecosystems or human health associated with your activities.

Row 1

(2.5.1.1) Water pollutant category

Select from:

☑ Other physical pollutants

(2.5.1.2) Description of water pollutant and potential impacts

Suspended solids can increase water turbidity, limiting photosynthesis and contributing to decreased oxygen and increased water temperature. This, in turn, has a negative impact on aquatic life.

(2.5.1.3) Value chain stage

Select all that apply

☑ Direct operations

(2.5.1.4) Actions and procedures to minimize adverse impacts

Select all that apply

☑ Discharge treatment using sector-specific processes to ensure compliance with regulatory requirements

(2.5.1.5) Please explain

HP identifies and classifies potential water pollutants in accordance with local monitoring requirements. For example, at our Malaysia facility, we comply with Standard B local regulations, by monitoring and treating 31 parameters, including Total Suspended Solid, with the potential to be detrimental to human health or the environment. We use laboratory testing as required to identify and treat potential water pollutants in our wastewater. We follow the same procedure at all sites with requirements to monitor for potential water pollutants. To minimize the adverse impacts of potential water pollutants on water ecosystems or human health associated with our activities, HP commits to meet or exceed all applicable legal requirements, local codes, and regulations around wastewater discharge. Pollutant levels must be at an acceptable level according to the requirements before we discharge.

Row 2

(2.5.1.1) Water pollutant category

Select from:

☑ Inorganic pollutants

(2.5.1.2) Description of water pollutant and potential impacts

Heavy metals such as Mercury, Lead and Cadmium, among others. Heavy metals in water have the potential to negatively impact aquatic flora and fauna, disturb ecosystems, and cause human health problems.

(2.5.1.3) Value chain stage

Select all that apply

☑ Direct operations

(2.5.1.4) Actions and procedures to minimize adverse impacts

Select all that apply

☑ Discharge treatment using sector-specific processes to ensure compliance with regulatory requirements

(2.5.1.5) Please explain

HP identifies and classifies potential water pollutants in accordance with local monitoring requirements at all sites. For example, at our Malaysia facility, we must comply with Standard B local regulations, which requires that we monitor and treat 31 parameters (including Mercury, Cadmium, and Lead in mg/L) that have the potential to be detrimental to human health or the environment. We use laboratory testing as required to identify and treat these potential water pollutants in our wastewater. We follow this same procedure at all sites where requirements to monitor for potential water pollutants exist. To ensure that we minimize the adverse impacts of potential water pollutants on water ecosystems or human health associated with our activities, HP is committed to meeting or exceeding all applicable legal requirements, local codes, and regulations when it comes to our wastewater discharge. This means that we monitor and treat for all potential pollutants as outlined in the applicable regulations. Pollutant levels must be at an acceptable level according to the requirements before we discharge.

Row 3

(2.5.1.1) Water pollutant category

Select from:

☑ Oil

(2.5.1.2) Description of water pollutant and potential impacts

Oil and greases can build up and harden in sanitary sewar systems, causing blockages, pipe bursts and overflows.

(2.5.1.3) Value chain stage

Select all that apply

☑ Direct operations

(2.5.1.4) Actions and procedures to minimize adverse impacts

Select all that apply

☑ Water recycling

☑ Discharge treatment using sector-specific processes to ensure compliance with regulatory requirements

(2.5.1.5) Please explain

HP identifies and classifies potential water pollutants, including oil and greases, in accordance with local monitoring requirements at all sites. We use laboratory testing as required to identify and treat these potential water pollutants in our wastewater. We follow this same procedure at all sites where requirements to monitor for potential water pollutants exist. To ensure that we minimize the adverse impacts of potential water pollutants on water ecosystems or human health associated with our activities, HP is committed to meeting or exceeding all applicable legal requirements, local codes, and regulations when it comes to our wastewater discharge. This means that we monitor and treat for all potential pollutants as outlined in the applicable regulations. Pollutant levels must be at an acceptable level according to the requirements before we discharge.

Row 4

(2.5.1.1) Water pollutant category

Select from:

☑ Other nutrients and oxygen demanding pollutants

(2.5.1.2) Description of water pollutant and potential impacts

Ammoniacal nitrogen is one pollutant we monitor for that can cause oxygen demand, stimulate excessive growth of algae, and be toxic to aquatic life.

(2.5.1.3) Value chain stage

Select all that apply

☑ Direct operations

(2.5.1.4) Actions and procedures to minimize adverse impacts

Select all that apply

☑ Discharge treatment using sector-specific processes to ensure compliance with regulatory requirements

(2.5.1.5) Please explain

HP identifies and classifies potential water HP identifies and classifies potential water pollutants in accordance with local monitoring requirements at all sites. For example, at our Malaysia facility, we must comply with Standard B local regulations, which requires that we monitor and treat 31 parameters, including Ammoniacal Nitrogen, that have the potential to be detrimental to human health or the environment. We use laboratory testing as required to identify and treat these potential water pollutants in our wastewater. We follow this same procedure at all sites where requirements to monitor for potential water pollutants exist. To ensure that we

minimize the adverse impacts of potential water pollutants on water ecosystems or human health associated with our activities, HP is committed to meeting or exceeding all applicable legal requirements, local codes, and regulations when it comes to our wastewater discharge. This means that we monitor and treat for all potential pollutants as outlined in the applicable regulations. Pollutant levels must be at an acceptable level according to the requirements before we discharge.
[Add row]

C3. Disclosure of risks and opportunities

(3.1) Have you identified any environmental risks which have had a substantive effect on your organization in the reporting year, or are anticipated to have a substantive effect on your organization in the future?

	Environmental risks identified

☑ Thailand
☑ Taiwan, China
☑ Hong Kong SAR, China
☑ United Arab Emirates
☑ United States of America
☑ United Kingdom of Great Britain and Northern Ireland
☑ Spain
☑ Brazil
☑ Canada
☑ France
☑ Mexico
☑ Viet Nam
☑ Australia
☑ Indonesia
☑ Netherlands
☑ Saudi Arabia

(3.1.1.9) Organization-specific description of risk

In 2023, HP engaged a third-party consultant to conduct scenario analysis to help us better understand our exposure to climate-related physical and transition risks. This initial analysis provided an evaluation of potential impacts that we are leveraging to determine whether any climate-related risks could be considered a principal risk for HP. Principal climate-related risks are those which have the potential to have a significant negative impact on the Company's business model or strategy. This analysis looked at plausible climate impacts out to 2050. Shift in demand towards low carbon products The analysis found that under all scenarios, the projected loss in sales would increase over time, and it would be higher under lower climate ambition scenarios such as the Current Policies, NDCs and Fragmented World scenarios, as the impacts of climate change would be higher, thereby negatively impacting GDP growth. We manage the risks and opportunities associated with the *shift in demand towards low carbon products through our carbon footprint reduction efforts described above and our R&D investment and Design for Circularity (DfC) program. Integrated into HP's product development process, DfC encompasses management systems, processes, tools, and company-wide collaboration. Applying sustainable design principles across our portfolio enables us to engineer energy, resource, and carbon efficiency gains in breakthrough technologies as well as successive product generation.*

(3.1.1.11) Primary financial effect of the risk

Select from:

☑ Disruption to sales

(3.1.1.12) Time horizon over which the risk is anticipated to have a substantive effect on the organization

Select all that apply

☑ Long-term

(3.1.1.13) Likelihood of the risk having an effect within the anticipated time horizon

Select from:

☑ Very likely

(3.1.1.14) Magnitude

Select from:

☑ High

(3.1.1.16) Anticipated effect of the risk on the financial position, financial performance and cash flows of the organization in the selected future time horizons

We are committed to maintaining compliance with all environmental laws applicable to our operations, products and services and to reducing our environmental impact across all aspects of our business. We meet this commitment with a comprehensive environmental, health and safety policy, strict environmental management of our operations and worldwide environmental programs and services. A liability for environmental remediation and other environmental costs is accrued when we consider it probable that a liability has been incurred and the amount of loss can be reasonably estimated. Environmental costs and accruals are presently not material to our operations, cash flows or financial position. Although there is no assurance that existing or future environmental laws applicable to our operations or products will not have a material adverse effect on our operations, cash flows or financial condition, we do not currently anticipate material capital expenditures for environmental control facilities.

(3.1.1.17) Are you able to quantify the financial effect of the risk?

Select from:

☑ Yes

(3.1.1.23) Anticipated financial effect figure in the long-term – minimum (currency)

1519500418

(3.1.1.24) Anticipated financial effect figure in the long-term – maximum (currency)

2173925367

(3.1.1.25) Explanation of financial effect figure

Our scenario analysis used gross domestic product (GDP) loss due to climate change to evaluate HP’s exposure to a shift in demand towards low-carbon products. GDP loss serves as a proxy for consumer sentiment that drives a change in consumer awareness and behavior. This analysis leveraged HP’s 2022 sales revenue data to gauge country-specific exposure to GDP effects. Zero sales growth was assumed in all regions to isolate the effects of consumer behavior from HP growth scenarios. Sales data was combined with NGFS scenario assumptions of GDP losses due to climate change under seven scenarios (i.e. Delayed Transition, Fragmented World, Current Policies, Nationally Determined Contributions (NDCs), Net Zero 2050, Below 2C, and Low Demand). The resulting annual financial impacts across the different climate scenarios provide an estimate of the level of risk that HP could be exposed to regarding a shift in consumer behavior towards low-carbon products. The following assumptions were made in the analysis: • All sales revenue streams were assumed to be affected identically by a shift in consumer behavior, regardless of carbon intensity of the products. • Consumers in all regions were assumed to react in the same way in the face of GDP losses due to climate change. • Consumer sentiment and behavior regarding demand for low-carbon products was assumed to align with changes in GDP due to climate change. The analysis found that under all scenarios, the projected loss in sales would increase over time, and it would be higher under lower climate ambition scenarios such as the Current Policies, NDCs and Fragmented World scenarios, as the impacts of climate change would be higher, thereby negatively impacting GDP growth.

(3.1.1.26) Primary response to risk

Infrastructure, technology and spending

☑ Increase investment in R&D

(3.1.1.27) Cost of response to risk

1556654

(3.1.1.28) Explanation of cost calculation

Cost calculation: The costs are integrated into product R&D and design, supplier and channel/partner management, and customer sales and support. The 1.55M is an internal estimate of direct costs involved in annual major product eco-label certification across HP personal systems and printer products for Energy Star, EPEAT and TCO. The total estimated number includes annual fees, verification testing fees, and per unit certification fees for the aforementioned ecolabels.

(3.1.1.29) Description of response

We are committed to continuously enhancing the energy performance of our products. We actively track, monitor, and contribute to the development of energy efficiency standards, ecolabels, and regulations. Currently, HP is providing ongoing support in revising EPEAT, TCO, and Energy Star (PCs) by participating in criteria development committees and serving as members of the Technical Committee. Engaging with these stakeholders and contributing to the development of these standards enables HP to stay ahead of emerging product efficiency requirements and regulations.

Water

(3.1.1.1) Risk identifier

Select from:

☑ Risk1

(3.1.1.3) Risk types and primary environmental risk driver

Policy

☑ Mandatory water efficiency, conservation, recycling or process standards

(3.1.1.4) Value chain stage where the risk occurs

Select from:

☑ Direct operations

(3.1.1.6) Country/area where the risk occurs

Select all that apply

☑ Malaysia

(3.1.1.7) River basin where the risk occurs

Select all that apply

☑ Other, please specify **:**Major basin: Peninsula Malaysia, Minor basin: Kurau

(3.1.1.9) Organization-specific description of risk

One of HP’s manufacturing facilities is located in Penang, Malaysia. The local water utility has instituted mandatory water conservation measures for industrial sites in order to prioritize water service to residential and other community usage during water shortages. In fact, water to the site has been curtailed completely on multiple occasions.

(3.1.1.11) Primary financial effect of the risk

Select from:

☑ Disruption in production capacity

(3.1.1.12) Time horizon over which the risk is anticipated to have a substantive effect on the organization

Select all that apply

☑ Short-term

(3.1.1.13) Likelihood of the risk having an effect within the anticipated time horizon

Select from:

☑ Virtually certain

(3.1.1.14) Magnitude

Select from:

☑ Medium-low

(3.1.1.16) Anticipated effect of the risk on the financial position, financial performance and cash flows of the organization in the selected future time horizons

Minimal (Risk has been mitigated)

(3.1.1.17) Are you able to quantify the financial effect of the risk?

Select from:

☑ Yes

(3.1.1.19) Anticipated financial effect figure in the short-term – minimum (currency)

0

(3.1.1.20) Anticipated financial effect figure in the short-term – maximum (currency)

220000

(3.1.1.25) Explanation of financial effect figure

Without a water storage tank, we would incur costs of approximately 220,000 USD per occurrence to purchase tankers of water from neighboring states during a 72-hour curtailment event. If water tankers were not available, it would impact our stock of inventory.

(3.1.1.26) Primary response to risk

Infrastructure, technology and spending

☑ Increase environment-related capital expenditure

(3.1.1.27) Cost of response to risk

1970000

(3.1.1.28) Explanation of cost calculation

The new water storage tank and associated infrastructure will cost approximately US1.97 million.

(3.1.1.29) Description of response

In addition to implementing water-conserving operational practices at the Penang site, we are investing in a mobile water storage tanker capable of holding up to 48 hours' worth of water for the site. This allows us to curtail water usage at the site to support prioritizing residential and community water users during water shortages.

[Add row]

(3.2) Within each river basin, how many facilities are exposed to substantive effects of water-related risks, and what percentage of your total number of facilities does this represent?

Row 1

(3.2.1) Country/Area & River basin

Spain

☑ Other, please specify :Ter-Llobregat

(3.2.2) Value chain stages where facilities at risk have been identified in this river basin

Select all that apply

☑ Direct operations

(3.2.3) Number of facilities within direct operations exposed to water-related risk in this river basin

1

(3.2.4) % of your organization's total facilities within direct operations exposed to water-related risk in this river basin

Select from:

☑ Less than 1%

(3.2.10) % organization's total global revenue that could be affected

Select from:

☑ 1-10%

(3.2.11) Please explain

Our facility in Barcelona, Spain (BCN) as being exposed to water risks that have the potential to have operational impact on our company. The area of Barcelona (Catalonia) experienced the worst drought in History in terms of extent, durations and intensity and due to this different local municipalities have put in place different measures to reduce water consumption. HP is committed to continuing to comply with savings measures proposed in the "Water management Plan" that include specific actions in situations of alert and any future legislation and guidelines established by public administrations to guarantee a responsible user of the water and preserve these vital resources. We are committed to implementing all the measures necessary to fulfill both of these objectives, taking concrete actions to reduce water consumption and improve efficiency in our facilities.

Row 2

(3.2.1) Country/Area & River basin

Malaysia

☑ Other, please specify **:**Major basin: Peninsula Malaysia, Minor basin: Kurau

☑ United Arab Emirates

(3.6.1.8) Organization specific description

Based on HP’s 2021 materiality assessment, which collected input from a broad range of stakeholders—including HP employees and executives, customers, suppliers, investors, NGOs, and peers, “Circular economy” rated highly in importance to external stakeholders and to HP. Through innovative products and services, we are providing our customers an increasingly circular experience. We extend product life through design, maintenance, upgrades, repair, and innovative service-based business models. At the end of service, we strive to reuse or recover all products. HP recognizes opportunities for circular economy-based solutions to better *serve and capture our core markets like printing supplies and "as a service" models as well as growth and future ones such as digital commercial print and 3D printing. For example, HP Instant Ink, a customized subscription ink delivery service, eliminates trips to the store and encourages recycling through the provision of prepaid envelopes to return used cartridges. And we are expanding to HP Instant Ink Platinum which extends our service offering to the hardware providing extended warranties with future changes around increased hardware circularity. Our vision is to become a fully circular company powered by service models and circular design in our products, which will affect every part of our business.*

(3.6.1.9) Primary financial effect of the opportunity

Select from:

☑ Increased revenues resulting from increased demand for products and services

(3.6.1.10) Time horizon over which the opportunity is anticipated to have a substantive effect on the organization

Select all that apply

☑ The opportunity has already had a substantive effect on our organization in the reporting year

(3.6.1.12) Magnitude

Select from:

☑ Medium

(3.6.1.13) Effect of the opportunity on the financial position, financial performance and cash flows of the organization in the reporting period

HP anticipates increasing business and regulatory pressure to report the circularity and transparency of HP's participation in the circular economy per EU CSRD and ESRS E5. European nations and contracts are starting to include the request for proposals that include reused products as part of contract requests. We are awaiting the impact of EU CSRD on the developing regulatory requirements of other nations. In particular, all multinational corporations are awaiting the SECs SOX compliance changes that may mirror aspects of EU CSRD. HP sees opportunities with these changes and has created HP Renew, where our HP Renew Solutions Commercial customers can reduce hardware expenses and accelerate sustainability goals with HP's flexible suite of certified refurbished devices, 125 services, 126 and solutions that enhance IT and employee experiences while helping protect our shared future. Renew is part of HP's 2030 Circularity Goal to achieve 75% product and packaging circularity by weight. HP's current circularity method matches ISO 59020 Inflow Circularity. HP is considering changes to the Circularity metric to consider the inclusion of outflows. And HP may be affected by future changes in ISO standards that may adopt different measurement methodologies being proposed by a variety of NGOs such as the Circular Transition Indicators (CTI) methodology. Further, ecolabels are evolving to include key aspects of both climate and circular economy.

(3.6.1.15) Are you able to quantify the financial effects of the opportunity?

Select from:

☑ No

(3.6.1.24) Cost to realize opportunity

10500000

(3.6.1.25) Explanation of cost calculation

Explanation of cost calculation: Total circularity costs for materials, product development, and supply chain are complex due to various direct, indirect manufacturing, and takeback strategies. Circular economy materials and designs are built into the costs of designs and other existing goals of projects. Therefore, we project costs based on assumptions of volume and market price per type of material. https://businessanalytiq.com/procurementanalytics/index/acrylonitrile-butadiene-styrene-abs-usa-price-index-2/(3.

(3.6.1.26) Strategy to realize opportunity

In 2021, HP announced a Climate Action strategy to reach 75% Circularity in products and packaging by 2030. This goal builds upon previously announced goals for 2025 established in 2019 to use 30% post-consumer recycled plastic in HP products and to reduce the intensity of single-use plastics in packaging by 75%. Thus, HP's circular economy strategy includes both near-term and long-term goals. HP's performance relative to these goals is published in HP's annual Sustainable Impact Report. For Fiscal Year 2023, HP used 337,100 metric tonnes of circular materials (recycled, renewable, and reused) achieving the use of 1 billion pounds of recycled materials and 4 billion pounds of circular materials since 2019. For more information on our circularity programs, see HP's 2023 Sustainable Impact Report at https://www8.hp.com/h20195/v2/GetPDF.aspx/c08980815.pdf and https://sustainability.ext.hp.com/en/support/solutions/articles/35000064465-please-explain-how-hp-is-driving-towards-circular-economy

(3.6.1.8) Organization specific description

In FY20, HP set a new potable water goal to reduce potable water withdrawal by 35% by 2025 from a 2015 baseline. HP refreshed its strategy to meet our 35% potable water reduction goal through capital projects, equipment upgrades, our sustainable construction playbook, and a focus on high-risk sites as defined by the WRI Aqueduct Water Risk Atlas tool. In 2023, we met and exceeded the 35% reduction goal, achieving 38% potable water reduction globally. We are now working on setting a new quantitative goal, while continuing to make progress on risk reduction. To continue to improve water efficiency, HP investigates opportunities at all sites, with a particular focus on sites that fall within the top 15 water withdrawal sites for HP globally. These sites include Corvallis, San Diego, Malaysia (PEN), Singapore (Depot Road and SIN), and Israel (Kiryat-Gat). The WRI Aqueduct Atlas assessment identified the sites in San Diego and Tijuana Mexico as sites with extremely high baseline water stress. HP continues to improve water efficiency at these sites by employing practices such as installing smart metering/leak detection, stipulating all new projects at these locations follow LEED v.4 Gold standards for water efficiency, and making water efficiency investments to minimize potable water withdrawal demands.

(3.6.1.9) Primary financial effect of the opportunity

(3.6.1.14) Anticipated effect of the opportunity on the financial position, financial performance and cash flows of the organization in the selected future time horizons

Estimated annual avoided costs in the US are: 23,081 in San Diego California, with expected annual water savings of 6,700 cubic meters, and 1,785 in Corvallis Oregon, with expected annual water savings of 2,045 cubic meters of water per year.

(3.6.1.15) Are you able to quantify the financial effects of the opportunity?

Select from:

☑ Yes

(3.6.1.17) Anticipated financial effect figure in the short-term - minimum (currency)

0

(3.6.1.18) Anticipated financial effect figure in the short-term – maximum (currency)

24866

(3.6.1.23) Explanation of financial effect figures

Kiryat Gat, Israel: HP deployed 31 new AI-enabled water management meters, which detect anomalies in water usage and alert our team to potential issues. The site’s total water consumption is now constantly monitored, and the system has identified multiple leaks before they caused serious damage and water waste. This *manufacturing site is designated by the WRI as a site with extremely high water stress, making responsible water management especially important. The cost to implement this project was 35,656. San Diego, California, United States: HP completed a project that enables this site to use recycled water in its cooling tower. This project is predicted to save 6,700 cubic meters of water per year, approximately 14% of the site's annual water consumption. Additionally, we initiated a water risk assessment at the end of 2023 and we are currently exploring further opportunities for water savings, as this site is designated by the WRI Aqueduct Water Risk Atlas tool as a site with extremely high water stress. The cost to implement this project was 165,816 and the estimated annual avoided costs are 23,081, with expected annual water savings of 6,700 cubic meters Corvallis, Oregon, United States: HP completed a project that modified the piping in a cooling tower to use blowdown water (water drained from the system to prevent mineral buildup) to flush the sand filter. The cost to implement this project will be 18,707 and the estimated annual avoided costs are 1,785, with expected annual water savings of 2,045 cubic meters of water per year. Also in Corvallis, HP started implementation of WINT water leak monitoring solution (incl. sub-metering installation). Malaysia, Pengang, HP started the Installation of additional water storage tanks to support production operations in case of shortages that was completed November 2023.*

(3.6.1.24) Cost to realize opportunity

0

(3.6.1.25) Explanation of cost calculation

Unknown as of today. To continue to improve water efficiency, HP investigates opportunities at all sites, with a particular focus on sites that fall within the top 15 water withdrawal sites for HP globally.

(3.6.1.26) Strategy to realize opportunity

To continue to improve water efficiency, HP investigates opportunities at all sites, with a particular focus on sites that fall within the top 15 water withdrawal sites for HP globally. These sites include Corvallis, San Diego, Malaysia and Singapore (Depot Road). The WRI Aqueduct Atlas assessment identified the sites in Israel and San Diego as sites with high and extremely high baseline water stress respectively. HP continues to improve water efficiency at these sites by employing practices such as installing smart metering/leak detection, stipulating all new projects at these locations follow LEED v.4 Gold standards for water efficiency, and making water efficiency investments to minimize potable water withdrawal demands. 2023 Examples are stated in section 3.6.1.23. We have more impactful projects that have been completed in 2024 or are in our pipeline and due to be completed later in 2024 or in 2025.

C4. Governance

(4.1) Does your organization have a board of directors or an equivalent governing body?

(4.1.1) Board of directors or equivalent governing body

Select from:

☑ Yes

(4.1.2) Frequency with which the board or equivalent meets

Select from:

☑ More frequently than quarterly

(4.1.3) Types of directors your board or equivalent is comprised of

Select all that apply

☑ Executive directors or equivalent

☑ Independent non-executive directors or equivalent

(4.1.4) Board diversity and inclusion policy

Select from:

☑ Yes, and it is publicly available

(4.1.5) Briefly describe what the policy covers

To be eligible for election to the Board, directors must meet certain criteria set forth in the Bylaws. In addition, directors should have the highest professional and personal ethics and values, consistent with HP's longstanding values and standards. They should have broad experience at the policy-making level in business, government, education, technology or public service. They should be committed to enhancing stockholder value and should have sufficient time to carry out their duties and to provide insight and practical wisdom based on experience. The Nominating, Governance and Social Responsibility Committee (NGSR C) takes into account a director's or potential director's ability to contribute to the Board's overall diversity (such as race, gender, age, and cultural diversity), experience, and composition. As part of the search process for each new director, the NGSR Committee actively seeks out diverse candidates to include in the pool from which Board nominees are chosen.

(4.1.6) Attach the policy (optional)

Engagement

☑ Implementation of employee awareness campaign or training program on environmental issues

(4.5.1.4) Incentive plan the incentives are linked to

Select from:

☑ Short-Term Incentive Plan, or equivalent, only (e.g. contractual annual bonus)

(4.5.1.5) Further details of incentives

The HR and Compensation ("HRC") Committee discharges the Board's responsibilities related to the general oversight of our compensation structure, including our equity compensation plans and benefit programs, as well as the compensation of our Executive Leadership Team and Directors. In particular, the HRC has designed a compensation program for our Executive Leadership Team that makes twenty-five percent of the target annual incentives of each member of our Executive Leadership Team contingent upon the achievement of qualitative objectives that it believes will contribute to HP's long-term success, including Growth, People, and Sustainable Impact.

(4.5.1.6) How the position's incentives contribute to the achievement of your environmental commitments and/or climate transition plan

Members of HP's executive team are also part of the establishment and achievement of targets related to sustainability such as the goal to reduce potable water consumption by 35% by 2025 with a focus on high-risk sites. Corporate Real Estate reports directly to the Chief Supply Chain Officer. Because of this, HP's Chief Supply Chain Officer (CSCO) has responsibility for establishing and overseeing achievement of HP's water goal to reduce potable water use by 35% by 2025 with a focus on high-risk sites, as measured by the WRI water risk aqueduct tool and any of our Corporate Real Estate's major capital expenditures, plans and budgets involving significant new facility builds or relocation of operations or manufacturing. These facilities' CAPEX plans and annual operating budgets have water-related implications involving both adequate water availability and meeting LEED v4 Gold standards for site selection, water management and efficiency.

Climate change

(4.5.1.1) Position entitled to monetary incentive

Board or executive level

☑ Chief Sustainability Officer (CSO)

(4.5.1.2) Incentives

Select all that apply

☑ Bonus - % of salary

☑ Salary increase

(4.5.1.3) Performance metrics

Targets

☑ Progress towards environmental targets

Emission reduction

☑ Reduction in absolute emissions

(4.5.1.4) Incentive plan the incentives are linked to

Select from:

☑ Both Short-Term and Long-Term Incentive Plan, or equivalent

(4.5.1.5) Further details of incentives

Our Chief Sustainability Officer (CSO) oversees the development of HP’s sustainability strategy, pan-HP goals and metrics, and communications and reporting. The CSO’s professional performance targets include their progress against external sustainability goals. At HP, an individual's performance on their annual targets directly impacts the results of their annual review and annual compensation and/or bonus.

(4.5.1.6) How the position’s incentives contribute to the achievement of your environmental commitments and/or climate transition plan

The CSO directs the establishment of and drives progress toward meeting HP targets related to climate such as our goal to reduce HP value chain GHG emissions by 50% by 2030 (compared to 2019) and achieve net zero emissions by 2040, reduce Scope 1 and Scope 2 GHG emissions from global operations by 60% by 2025 (compared to 2015), achieve 100% renewable electricity in HP operations by 2025, and reach 30% product use GHG emissions intensity by 2025, compared to 2015.

☑ Organization-wide

(4.6.1.3) Value chain stages covered

Select all that apply

☑ Direct operations

☑ Upstream value chain

☑ Downstream value chain

☑ Portfolio

(4.6.1.4) Explain the coverage

Climate change is one of the most significant and urgent issues facing business and society today. The science is clear, the impacts are serious, and the time to act is now. HP's ambitious new climate action goals focus on halving our Scope 1, 2 and 3 emissions by 2030, compared to 2019, and achieving net zero across our entire value chain by 2040. Our strategy encompasses carbon emissions, circularity and forests, making it among the most comprehensive in the technology industry. This three-pronged approach focuses on reducing carbon emissions—a main driver of climate change—increasing circularity, which reduces emissions from resource consumption, and investing in forests to sequester carbon and create more resilient ecosystems.

(4.6.1.5) Environmental policy content

Environmental commitments

☑ Commitment to a circular economy strategy

☑ Commitment to comply with regulations and mandatory standards

☑ Commitment to take environmental action beyond regulatory compliance

☑ Commitment to implementation of nature-based solutions that support landscape restoration and long-term protection of natural ecosystems

☑ Commitment to stakeholder engagement and capacity building on environmental issues

Climate-specific commitments

☑ Commitment to 100% renewable energy

☑ Commitment to net-zero emissions

Additional references/Descriptions

☑ Description of impacts on natural resources and ecosystems

☑ Description of renewable electricity procurement practices

☑ Reference to timebound environmental milestones and targets

(4.6.1.6) Indicate whether your environmental policy is in line with global environmental treaties or policy goals

Select all that apply

☑ Yes, in line with the Paris Agreement

(4.6.1.4) Explain the coverage

HP's publicly available companywide Resource Conservation Policy specifically reflects a commitment to global consistency in our approach to water security. Its purpose is to make clear our commitment internally and externally on how our water stewardship is in alignment with the UN Sustainable Development Goals. It describes our business dependency on water and recognizes our impact and reliance on water resources and our ability to positively impact critical issues affecting the environment and communities worldwide through our actions and investments. We strive to achieve our water targets by reducing our use of freshwater through water efficiency initiatives, water reuse, recycled water, and rainwater capture and prioritizing sites identifying as having a high-water risk as identified by the World Resources Institute Aqueduct Water Risk Atlas. We also highlight the linkages between resource usage and environmental and social issues, such as climate change, and our commitment to the sourcing and purchasing of services and products that conserve and protect energy, water, or other natural resources. HP Resource Conservation Policy - https://h20195.www2.hp.com/v2/GetDocument.aspx?docnamec06683013

(4.6.1.5) Environmental policy content

Environmental commitments

☑ Commitment to comply with regulations and mandatory standards

☑ Commitment to take environmental action beyond regulatory compliance

☑ Commitment to stakeholder engagement and capacity building on environmental issues

Water-specific commitments

☑ Commitment to reduce or phase out hazardous substances

☑ Commitment to control/reduce/eliminate water pollution

☑ Commitment to reduce water consumption volumes

☑ Commitment to water stewardship and/or collective action

Additional references/Descriptions

☑ Acknowledgement of the human right to water and sanitation
☑ Description of impacts on natural resources and ecosystems
☑ Recognition of environmental linkages and trade-offs
☑ Reference to timebound environmental milestones and targets

(4.6.1.6) Indicate whether your environmental policy is in line with global environmental treaties or policy goals

(4.10) Are you a signatory or member of any environmental collaborative frameworks or initiatives?

(4.10.1) Are you a signatory or member of any environmental collaborative frameworks or initiatives?

Select from:

☑ Yes

(4.10.2) Collaborative framework or initiative

Select all that apply

☑ RE100
☑ UN Global Compact
☑ We Are Still In
☑ The Climate Pledge
☑ Race to Zero Campaign
☑ Science-Based Targets Initiative (SBTi)
☑ Other, please specify **:EV 100**

(4.10.3) Describe your organization's role within each framework or initiative

RE100: In 2016, HP joined RE100 with a global commitment to using 100% renewable electricity, demonstrating its commitment to integrating sustainability into its core business strategy. UN Global Compact: a voluntary and strategic policy initiative for businesses that are committed to aligning their operations and strategies with 10 universally accepted principles in the areas of human rights, labor, environment, and anti-corruption. HP Inc is an active member of the UN Global Compact, and has been a participant since August 2002. EV 100: HP is one of 10 founding members of EV100, a Climate Group initiative aimed at accelerating technological development of electric vehicles (EVs) worldwide. In support of this effort, we have committed to installing EV infrastructure at all feasible sites worldwide by 2030. We Are Still In: We Are Still In is a joint declaration of support for climate action, signed by more than 3,900 CEOs, mayors, governors, college presidents, and others. HP is a business signatory. The Climate Pledge: HP joined as a signatory in August 2021. Signatories agree to regular reporting, carbon elimination, and credible offsets. Race to Zero Campaign: Each of the Race to Zero members below are committed to the same overarching goal: reducing emissions, across all scopes, swiftly and fairly in line with the Paris Agreement, with transparent action plans and robust near-term targets. Science-Based Targets Initiative (SBTi): drives ambitious climate action in the private sector by enabling companies to set science-based emissions reduction targets. HP is Business Ambition for 1.5 Campaign

member and validated our carbon reduction targets as part of the Science-Based Targets initiative (SBTi). HP Inc. commits to reduce absolute scope 1 and 2 GHG emissions 65% by FY2025 from a FY2015 base year. HP Inc. also commits to reduce absolute scope 3 GHG emissions 50% by FY2030 from a FY2019 base year. HP belongs to or affiliates with many organizations that address environmental and social issues. See the link for additional examples.

(4.11) In the reporting year, did your organization engage in activities that could directly or indirectly influence policy, law, or regulation that may (positively or negatively) impact the environment?

(4.11.1) External engagement activities that could directly or indirectly influence policy, law, or regulation that may impact the environment

Select all that apply

☑ Yes, we engaged directly with policy makers

☑ Yes, we engaged indirectly through, and/or provided financial or in-kind support to a trade association or other intermediary organization or individual whose activities could influence policy, law, or regulation

(4.11.2) Indicate whether your organization has a public commitment or position statement to conduct your engagement activities in line with global environmental treaties or policy goals

Select from:

☑ Yes, we have a public commitment or position statement in line with global environmental treaties or policy goals

(4.11.3) Global environmental treaties or policy goals in line with public commitment or position statement

Select all that apply

☑ Paris Agreement

☑ Sustainable Development Goal 6 on Clean Water and Sanitation

(4.11.4) Attach commitment or position statement

HP - Climate Action Policy Position.pdf

(4.11.5) Indicate whether your organization is registered on a transparency register

Select from:

☑ Yes

(4.11.6) Types of transparency register your organization is registered on

Select all that apply

☑ Mandatory government register

(4.11.7) Disclose the transparency registers on which your organization is registered & the relevant ID numbers for your organization

Office of the Clerk – U.S. House of Representatives Relevant ID Numbers: Senate ID #18158-12 House ID #310000000

(4.11.8) Describe the process your organization has in place to ensure that your external engagement activities are consistent with your environmental commitments and/or transition plan

Climate change related policy advocacy activities are governed by the HP Climate Policy Position and HP's 2030 Sustainable Impact Strategy. This position, along with HP's 2030 Sustainable Impact Strategy are also integrated into global governmental relations overall policy priorities that are posted publicly and globally guides policy engagement activities. During FY23, the HP government affairs team utilized our materiality assessments and conducted stakeholder interviews to determine the key environmental issues for our organization, which were then cross referenced against HP business objectives and imperatives. Ad hoc meetings are held as needed for emerging issues and advocacy opportunities, such as preparation for UN General Assembly, and the World Economic Forum, NY Climate Week, and other key sustainability related events where HP may lend its voice to climate solutions presented at these events. In 2021, HP signed on to the Alliance of CEO Climate Leaders, calling on bold climate policy agreements at COP26 to help businesses accelerate emission reductions, scale up innovations and achieve a net-zero world by 2050. The Alliance also encourages all business leaders to set (science-based) targets to halve emissions by 2030 and reach net-zero by 2050 with a clear roadmap as well as to provide transparency on emissions and their financial impact, for example in line with the recommendations of the Task Force on Climate-Related Financial Disclosures (TCFD).

(4.11.2.7) Indicate whether your organization attempted to influence the organization or individual's position in the reporting year

Select from:

☑ Yes, we publicly promoted their current position

(4.11.2.8) Describe how your organization's position is consistent with or differs from the organization or individual's position, and any actions taken to influence their position

ITI (https://www.itic.org/) supports government policies to achieve the following, all with the intent of both mitigating and adapting to climate change, and doing so with increased public/private partnership: • Concluding, and then implementing, a climate change agreement at COP 21 that takes a strong step forward toward a vibrant, low carbon, and sustainable future, as well as creating a transparent platform for countries to make and track national emissions reduction commitment; • Establishing greenhouse gas emissions reduction strategies, via a transparent and participatory process, that create a stable regulatory and investment environment for low-carbon innovation and that emphasize cost effectiveness; • Establishing national strategies to encourage innovative intelligent efficiency Solutions that utilize and enable ICT solutions • Promoting and protecting strong global intellectual property regimes, which are essential to incentivize high risk research and development and facilitate the dissemination of relevant transformative new technologies; • With regard to fluorinated gases, an essential component in manufacturing the semiconductors that are the fundamental building block of all ICT, focusing on reducing emissions of these gases rather than prohibiting their use per se; • Helping ensure that the Internet of Things is leveraged consistent with the ITI IoT Principles; and • Ensuring that ENERGY STAR and other relevant market recognition programs are based on partnership with industry and adherence to. (More information at http://www.itic.org/policy/energy/climate-change and http://www.itic.org/resources/ITIStatementonClimateChange_final.pdf). HP engages with other trade associations as well.

(4.11.2.9) Funding figure your organization provided to this organization or individual in the reporting year (currency)

400000

(4.11.2.10) Describe the aim of this funding and how it could influence policy, law or regulation that may impact the environment

As a member of the Information Technology Industry Council, HP aims to promote public policies that advance innovation and competition across the globe. This includes advocating for policies that enable responsible and sustainable technology design and manufacturing. HP is also the Chair of ITI's Climate Committee where we help set the agenda for the association to engage in global and regional policies that help accelerate laws and regulations that combat climate change.

(4.11.2.11) Indicate if you have evaluated whether your organization's engagement is aligned with global environmental treaties or policy goals

Select from:

☑ Yes, we have evaluated, and it is aligned

☑ Consistent

(4.11.2.7) Indicate whether your organization attempted to influence the organization or individual's position in the reporting year

Select from:

☑ Yes, we publicly promoted their current position

(4.11.2.8) Describe how your organization's position is consistent with or differs from the organization or individual's position, and any actions taken to influence their position

The Silicon Valley Leadership Group (SVLG; http://svlg.org/) is a public policy trade association. The Leadership Group represents more than 375 of Silicon Valley's most respected employers on issues, programs and campaigns that affect the economic health and quality of life in Silicon Valley, including education, energy, environment, health, housing, tax policies, tech and innovation and transportation. Leadership Group members collectively provide nearly one of every three private sector jobs in Silicon Valley and contribute more than 3 trillion to the worldwide economy. Silicon Valley is leading the way in innovating and adopting cutting-edge technologies and regulatory regimes, both critical for providing the solutions and the market certainty needed to reduce greenhouse gas emissions. SVLG served as part of the Executive and Steering Committees for the victorious 2010 No on Proposition 23 Campaign to prevent the rollback of California's landmark Global Warming Solutions Act – Assembly Bill 32. The Leadership Group continues to work with the other members of this successfully campaign as part of Californians for Clean Energy and Jobs, a bipartisan coalition promoting California's clean energy future. The SVLG also continue to be a key player in helping ensure the implementation of AB 32 rewards efficiency, protects innovation and provides flexibility to seek out, and implements the lowest-cost solutions, while also meeting our greenhouse gas reduction goals. In addition, the Leadership Group is increasingly active in federal-level advocacy for smart energy and climate policies. In 2019, HP was one of four Silicon Valley area technology companies that worked with SVLG in partnership with Business Climate Leaders (BCL) on a study conducted by Aligned Incentives on the impact of U.S. Carbon pricing policy models on company energy costs in order to have a basis for building coalitions in support of advocating a price on carbon. HP engages with other trade associations as well.

(4.11.2.9) Funding figure your organization provided to this organization or individual in the reporting year (currency)

50000

(4.11.2.10) Describe the aim of this funding and how it could influence policy, law or regulation that may impact the environment

Since becoming a founding member of the SVLG in 1977, HP's membership aims to advance and enable the innovation industry in Silicon Valley and throughout California. HP employees work with SVLG to promote responsible environmental and sustainability policies to address climate change and advocating for racial justice policies to promote BIPOC equity in our company and communities.

(5.1.1.10) Assumptions, uncertainties and constraints in scenario

The analysis leveraged HP's 2022 GHG inventory data and projected emissions under future reduction trajectories (4.2% annual absolute reduction through 2040 aligned with HP target of becoming Net Zero by 2040), as well as a business-as-usual trajectory where emissions remain constant at 2022 levels. These emissions projections were then shocked with carbon pricing data from seven NGFS climate scenarios (i.e. Delayed Transition, Fragmented World, Current Policies, Nationally Determined Contributions (NDCs), Net Zero 2050, Below 2C, and Low Demand) to determine financial values that provide an indication of the level of climate policy stringency that HP may be exposed to in the future, up to 2050. The analysis included Scope 1 and Scope 2 emissions at the country level, and Scope 3 emissions, by category, at the global level. Country-specific carbon prices were applied to HP's Scope 1 and Scope 2 emissions, whereas for Scope 3 emissions a global average carbon price was applied.

(5.1.1.11) Rationale for choice of scenario

As part of a transition risk analysis, HP conducted a risk screening of key transition risks associated with its operations. Risks were identified based on analysis performed by HP in 2019/20 and 2023, which provided qualitative transition risk levels. Peer benchmarking was also performed to ensure that a comprehensive set of risks were considered. The main risks identified were carbon pricing, product efficiency, shifts in consumer preferences, and raw material sourcing and related supply chain risks. Transition risks were then prioritized by assessing each risk's historical impact on the company using prior qualitative assessments and through stakeholder interviews. These assessments and interviews comprised the inputs for determining the top risks to be included in a screening process. For these top risks, a scenario-based screening was performed, which analyzed qualitative risk levels across 7 scenarios. HP's emissions and sales data were combined with inherent risk levels to assess potential qualitative transition risk impacts on our operations.

(5.1.1.9) Driving forces in scenario

Local ecosystem asset interactions, dependencies and impacts

☑ Climate change (one of five drivers of nature change)

(5.1.1.10) Assumptions, uncertainties and constraints in scenario

Our most recent physical risk scenario analysis evaluated 154 sites globally, including 44 HP-operated facilities and 110 sites representing suppliers receiving 1% or greater of HP's supplier spend. The analysis was performed using the latest suite of climate datasets aligned with the Inter-governmental Panel on Climate Change (IPCC) AR6 and evaluated 2 physical hazards (drought, water stress). To identify the most relevant physical risks for HP, the selected HP assets and supplier sites were modeled to assess future exposure to climate hazards. The analysis generated a score to assess risk exposure levels for each hazard (e.g., 0%-20% lowest risk, 80%-100% highest risk). These risk scores were examined across scenarios, emphasizing SSP5-8.5 as the highest physical risk scenario. Climate-related risks were identified as those with elevated climate risk under SSP5-8.5, defined as those sites with 60% risk score and above for 2030 and 2050.

(5.1.1.11) Rationale for choice of scenario

We selected the SSP5-8.5 physical risk scenario because it represents a high-risk future characterized by rapid economic growth driven by fossil-fuel development, leading to significant challenges in climate change mitigation. This scenario allows us to rigorously assess the potential physical impacts of severe climate change on our operations and supply chain under conditions where global warming exceeds 4C by 2100. By focusing on SSP5-8.5, we can better understand the extreme risks associated with delayed climate action, such as increased frequency and intensity of extreme weather events. This approach ensures that our risk management strategies are prepared to address the most challenging and adverse climate outcomes, aligning our efforts with the need to build resilience in the face of potentially severe global climate disruptions.

(5.1.1.10) Assumptions, uncertainties and constraints in scenario

Our scenario analysis used gross domestic product (GDP) loss due to climate change to evaluate HP's exposure to a shift in demand towards low-carbon products. GDP loss serves as a proxy for consumer sentiment that drives a change in consumer awareness and behavior. This analysis leveraged HP's 2022 sales revenue data to gauge country-specific exposure to GDP effects. Zero sales growth was assumed in all regions to isolate the effects of consumer behavior from HP growth scenarios. Sales data was combined with NGFS scenario assumptions of GDP losses due to climate change under seven scenarios (i.e. Delayed Transition, Fragmented World, Current Policies, Nationally Determined Contributions (NDCs), Net Zero 2050, Below 2C, and Low Demand). The resulting annual financial impacts across the different climate scenarios provide an estimate of the level of risk that HP could be exposed to regarding a shift in consumer behavior towards low-carbon products. The following assumptions were made in the analysis: - All sales revenue streams were assumed to be affected identically by a shift in consumer behavior, regardless of carbon intensity of the products. - Consumers in all regions were assumed to react in the same way in the face of GDP losses due to climate change. - Consumer sentiment and behavior regarding demand for low-carbon products was assumed to align with changes in GDP due to climate change.

(5.1.1.11) Rationale for choice of scenario

As part of a transition risk analysis, HP conducted a risk screening of key transition risks associated with its operations. Risks were identified based on analysis performed by HP in 2019/20 and 2023, which provided qualitative transition risk levels. Peer benchmarking was also performed to ensure that a comprehensive set of risks were considered. The main risks identified were carbon pricing, product efficiency, shifts in consumer preferences, and raw material sourcing and related supply chain risks. Transition risks were then prioritized by assessing each risk's historical impact on the company using prior qualitative assessments and through stakeholder interviews. These assessments and interviews comprised the inputs for determining the top risks to be included in a screening process. For these top risks, a scenario-based screening was performed, which analyzed qualitative risk levels across 7 scenarios. HP's emissions and sales data were combined with inherent risk levels to assess potential qualitative transition risk impacts on our operations.

(5.1.1.10) Assumptions, uncertainties and constraints in scenario

Our most recent physical risk scenario analysis evaluated 154 sites globally, including 44 HP-operated facilities and 110 sites representing suppliers receiving 1% or greater of HP's supplier spend. The analysis was performed using the latest suite of climate datasets aligned with the Inter-governmental Panel on Climate Change (IPCC) AR6 and evaluated 7 physical hazards (Extreme hear, coastal flooding, extreme cold, riverine flooding, extreme rainfall flooding, wildfire and cyclones). To identify the most relevant physical risks for HP, the selected HP assets and supplier sites were modeled to assess future exposure to climate hazards. The analysis generated a score to assess risk exposure levels for each hazard (e.g., 0%-20% lowest risk, 80%-100% highest risk). These risk scores were examined across scenarios, emphasizing SSP5-8.5 as the highest physical risk scenario. Climate-related risks were identified as those with elevated climate risk under SSP5-8.5, defined as those sites with 60% risk score and above for 2030 and 2050.

(5.1.1.11) Rationale for choice of scenario

We selected the SSP5-8.5 physical risk scenario because it represents a high-risk future characterized by rapid economic growth driven by fossil-fuel development, leading to significant challenges in climate change mitigation. This scenario allows us to rigorously assess the potential physical impacts of severe climate change on our operations and supply chain under conditions where global warming exceeds 4C by 2100. By focusing on SSP5-8.5, we can better understand the extreme risks associated with delayed climate action, such as increased frequency and intensity of extreme weather events. This approach ensures that our risk management strategies are prepared to address the most challenging and adverse climate outcomes, aligning our efforts with the need to build resilience in the face of potentially severe global climate disruptions.

(5.1.2.2) Coverage of analysis

Select from:

☑ Organization-wide

(5.1.2.3) Summarize the outcomes of the scenario analysis and any implications for other environmental issues

Based on this analysis, HP's highest risk of exposure to climate-related carbon pricing regulation lies within the supply chain, with emissions from Purchased Goods and Services and Use of Sold Products constituting the largest share of exposure. This risk exists in the short-, medium- and long-term, and increases with time, with the highest risk found in the long term (2050). The principal strategy HP uses to manage the risk posed by carbon pricing is our carbon reduction goals. In 2022, the Science Based Targets initiative (SBTi) validated two HP near-term GHG emissions– reduction targets, confirming HP's commitment to climate action to limit global warming to 1.5C. Pursuing an emissions reduction trajectory in line with our target to become net zero by 2040 aims to mitigate our exposure to financial implications associated with regulatory changes related to carbon pricing. We work closely with our suppliers to improve their environmental programs and report progress transparently. To ensure our suppliers' climate action ambitions align with our own, since 2018, through our Supplier Sustainable Impact Scorecard, we have required them to set science-based GHG emissions–reduction targets. We continue to deepen engagement with suppliers representing GHG emissions "hot spots" in our supply chain—such as LCD panels, printed circuit board assemblies, and memory and storage—identified through LCAs and directly collected data. While GHG emissions from HP operations only represent 1% of our footprint, we work to demonstrate leadership in emissions management, reduction, and disclosure. At HP sites around the world, we are taking action to reduce our GHG emissions through company-wide initiatives and site improvements, including by reducing energy consumption through optimization and efficiency projects and increasing offsite renewable energy partnerships and onsite renewable electricity. Our scenario analysis also used gross domestic product (GDP) loss due to climate change to evaluate HP's exposure over the short-, medium- and long-term to a shift in demand towards low-carbon products. The analysis found that under all scenarios, a projected loss in sales arises in the short-, medium-, and long-term, increasing over time, and it would be higher under lower climate ambition scenarios such as the Current Policies, NDCs and Fragmented World scenarios, as the impacts of climate change would be higher, thereby negatively impacting GDP growth. While the shift in demand towards low carbon products presents risk to HP, we also recognize this shift as a principal climate-related opportunity. We manage the risk and work to realize the opportunity through our carbon footprint reduction efforts described above and our R&D investment and Design for Circularity (DfC) program. This analysis found that acute physical risks could impact the book value of HP's assets across our operations. Acute physical impacts such as flooding and hurricanes can cause physical damage to our facilities, impair inventory and damage onsite equipment, leading to increased costs to replace or repair damages resulting from storm impacts. HP could also experience impacts to our supply chain from increasing *frequency and severity of acute physical impacts. If HP's suppliers are impacted by physical risks such as flooding, hurricanes and other extreme weather events, they may experience delays in product development and shipments, thereby delaying product delivery to HP, which could potentially negatively impact sales and revenue, as well as increase costs to remedy supply chain disruptions. Reducing global emissions is critical to reducing physical climate risks. At the corporate level, this takes place through HP's carbon reductions goals described above. For nearer term physical risks, HP's Supply Chain Operations team uses EA to provide real-time monitoring of numerous categories of risk incidents, including weather and natural disasters, across thousands of supplier, operations, and logistics sites. Depending on the event, resilience plans at the facility level are activated in order to minimize potential disruptions to HP's operations and supply chain. Complementing the Supply Chain Operations Team work is HP's Global Risk Management function, which is responsible for protecting HP against monetary impacts from casualty.*

Water

(5.1.2.1) Business processes influenced by your analysis of the reported scenarios

Select all that apply

☑ Risk and opportunities identification, assessment and management

(5.1.2.2) Coverage of analysis

Select from:

☑ Organization-wide

(5.1.2.3) Summarize the outcomes of the scenario analysis and any implications for other environmental issues

The analysis revealed that HP's operations and supply chain are exposed to water-related risks, particularly in regions where water is a critical input for manufacturing, several supplier sites and HP-operated facilities are projected to experience increased water stress and drought conditions by 2030 and 2050. This poses a risk of reduced water availability, which could impact production processes, increase operational costs, and disrupt supply chains. Impact on Supply Chain: Suppliers located in water-stressed regions are at heightened risk of facing operational disruptions due to water shortages. This could lead to delays in product development and shipments, potentially affecting HP's ability to meet customer demand. The analysis highlighted the need for HP to work closely with suppliers to develop water management strategies and resilience plans to mitigate the impact of water scarcity on production and supply chain continuity. Implications for HP's Operations: HP's own operations are also at risk, especially in regions where water is essential for cooling systems and other critical processes. The scenario analysis indicates that without proactive measures, HP could face increased costs related to water procurement, treatment, and conservation efforts. The company's water risk assessment, conducted annually using the WRI Aqueduct tool, identified specific sites that are vulnerable to water scarcity and quality issues. This ongoing assessment helps HP prioritize actions to manage water-related risks effectively. The scenario analysis provided critical insights into the potential water-related risks HP could face under various climate scenarios. The findings highlight the importance of proactive water management strategies to ensure the resilience of HP's operations and supply chain in the face of increasing water stress and drought conditions. As a result, HP is committed to strengthening its water stewardship efforts, aligning with global best practices, and continuing to assess and mitigate water-related risks as part of its broader environmental strategy.
[Fixed row]

(5.2) Does your organization’s strategy include a climate transition plan?

(5.2.1) Transition plan

Select from:

☑ Yes, we have a climate transition plan which aligns with a 1.5°C world

(5.2.3) Publicly available climate transition plan

Select from:

☑ Yes

(5.2.4) Plan explicitly commits to cease all spending on, and revenue generation from, activities that contribute to fossil fuel expansion

Select from:

☑ No, but we plan to add an explicit commitment within the next two years

(5.2.6) Explain why your organization does not explicitly commit to cease all spending on and revenue generation from activities that contribute to fossil fuel expansion

HP is a leading global provider of personal computing and other digital access devices, imaging and printing products, and related technologies, solutions and services. We sell to individual consumers, small- and medium-sized businesses (“SMBs”) and large enterprises, including customers in the government, health and education sectors. HP’s corporate investments include certain business incubation and investment projects. HP’s business does not focus on either spending on nor revenue generated from activities that contribute to fossil fuel expansion. Our primary external commits climate transition plan is focused on reduction of emissions from our value chain and our external commitments reflect this.

(5.2.7) Mechanism by which feedback is collected from shareholders on your climate transition plan

Select from:

☑ We have a different feedback mechanism in place

(5.2.8) Description of feedback mechanism

HP covers our transition plan in a variety of fora, including our annual Sustainable Impact reporting, as well as in our quarterly engagement with investors, including our meetings with key stakeholders and in our investor materials.

(5.2.9) Frequency of feedback collection

Select from:

☑ Annually

(5.2.10) Description of key assumptions and dependencies on which the transition plan relies

Assumptions: Our business and results of operations could be disrupted extreme weather conditions or other effects of climate Our operations, supply chain and our products are currently, and expected to become increasingly subject to federal, state, local and foreign laws, regulations and international treaties relating to climate change, such as climate disclosure, carbon pricing or product energy efficiency requirements, requiring us to comply or potentially face market access limitations or other sanctions including fines. Increasing concern over climate change has resulted, and we expect will continue to result, in transition risks such as shifting customer preferences and regulations, including with regard to our products and their environmental impact. Dependencies: Availability and cost of low- or non-carbon-based energy sources, Ability to decarbonize semiconductor supply chain and logistics supply chain due to current use of (respectively) greenhouse gasses in manufacturing processes and fossil fuels in product transportation

(5.2.11) Description of progress against transition plan disclosed in current or previous reporting period

The manufacturing, delivery, and use of HP products and solutions require a substantial amount of energy and natural resources. Transforming HP to help drive a more efficient and circular net zero carbon economy is central to our Sustainable Impact strategy. HP was the first global IT company to publish a full carbon footprint, which covers our entire global value chain, from our suppliers to our operations and our millions of customers worldwide. We continually measure and manage our environmental footprint across the value chain, pursuing areas for improvement. In 2023, our carbon footprint equaled 19,764,400 tonnes of CO2e, 27% less than in 2019. This included an 18% reduction in absolute GHG emissions related to product manufacturing and a 39% decrease associated with product energy use. Since 63% of our emissions occur in our supply chain, we use our scale and scope to engage closely with suppliers. This includes encouraging suppliers to address their own impacts, such as by setting science-based targets to reduce emissions. A little more than one-third of HP's carbon footprint derives from product energy use. We work to continually improve product energy efficiency, and also deliver innovative service-based solutions that help customers reduce their environmental impacts. While GHG emissions from HP operations only represent 1% of our footprint, we work to demonstrate leadership in emissions management, reduction, and disclosure. Our global operations produced 146,400 tonnes of Scope 1 and Scope 2 CO2e emissions during 2023, a 3% decrease compared to 2022. In early 2024, we submitted HP's 2040 net zero goal to the Science Based Targets initiative (SBTi) for validation. This builds on HP's two near-term GHG emissions–reduction targets, validated by the SBTi in 2022, confirming HP's commitment to climate action that limits global warming to 1.5.

☑ Water

(5.3.1.3) Describe how environmental risks and/or opportunities have affected your strategy in this area

Climate-related risks and opportunities related to product and services innovation, regulations and standards, and customer preferences and requirements are identified in HP's climate risk assessment and influence HP's products and services strategy. We strive to reduce the climate impact of our products and services to reduce HP's carbon footprint and help our customers' decrease energy consumption and GHG emissions. HP's sustainable revenue in 2023 represented more than 60% of total revenue, reported in accordance with the Corporate Knights Sustainable Economy Taxonomy, which defines sustainable revenue as revenue from products and services that help reduce environmental impacts. If HP were not to take a proactive approach to making products that meet or exceed product energy efficiency regulations and standards to maintain our access to key markets and public sector accounts, this revenue could be at risk. To address this, HP made a strategic decision to reduce absolute Scope 3 GHG emissions 50% by FY2030 from a FY2019 base year (this goal has been approved by the Science Based Targets Initiative.) Setting targets in support of our strategy, we looked at an approximate ten-year timeframe, while still addressing near term risk such as current or emerging regulations. The ten-year strategy is also informed by product development roadmaps to account for current and successive generations of products. ii) Most substantial business decisions: In 2021, HP announced Climate Action goals, including a goal to reduce HP value chain GHG emissions by 50% by 2030 (compared to 2019) and achieve net zero emissions by 2040. In 2023 our carbon footprint equaled 19,764,400 tonnes of CO2e, 27% less than in 2019. This included and 18% reduction in absolute GHG emissions related to product manufacturing and a 39% decrease associated with product energy use. Ongoing design improvements, including more efficient CPUs, panels, and power supplies, have contributed to continued reductions in the typical energy consumption of our notebooks and workstations.

(5.3.1.2) Environmental issues relevant to the risks and/or opportunities that have affected your strategy in this area

Select all that apply

☑ Climate change

(5.3.1.3) Describe how environmental risks and/or opportunities have affected your strategy in this area

Description & time horizon: Our supply chain makes up 63% of our overall footprint, so our production and nonproduction suppliers are essential partners in driving the low-carbon and resource-efficient transformation to meet our targets. Setting long-term targets in support of our strategy, we look at an approximate 10–20-year timeframe, while still addressing near term risk such as current or emerging regulations. Targets include a goal to reduce first tier production supplier and product transportation-related GHG emissions intensity by 10% by 2025 (compared to 2015) which we achieved in 2023 and a goal to help suppliers cut 2 million tons of carbon dioxide equivalent (CO2e) emissions between 2010 and 2025. ii) Most substantial business decisions: For more than a decade, HP has worked with suppliers and product transportation providers to track and reduce GHG emissions, improve energy and fuel efficiency, set goals, and improve environmental performance and report progress transparently. The Supplier Sustainable Impact Scorecard is central to our efforts to set expectations, evaluate our suppliers' performance, and drive

ongoing improvement. We periodically increase our expectations of suppliers, so suppliers must continually improve to maintain a consistent audit score. In 2018, we made the strategic decision to include new supplier environmental management criteria including science-based GHG emissions reduction targets, and third-party verification of GHG emissions, as well as transparent reporting through CDP of key environmental information, including GHG emissions, energy consumption, renewable energy use, and water management. Suppliers discuss their Scorecard with HP as part of regular business performance evaluations and receive additional points if they demonstrate sustained improvement. We continue to expand the scope of the Scorecard and have started implementing new criteria to raise expectations and raised thresholds for the Preferred and Acceptable levels. During the year, the Supplier Sustainable Impact Scorecard applied to suppliers representing 46% of our production spend.

(5.3.2.4) Describe how environmental risks and/or opportunities have affected these financial planning elements

Environmental risks and opportunities influence HP's financial planning across multiple elements. Proactive strategies and investments in sustainability initiatives not only help mitigate risks but also enable the company to meet our Sustainability goals. For example, Through HP's five climate action strategic drivers— print and compute as a service, sustainable materials, supply chain decarbonization, energy efficiency, and forest investments—we aim to reduce GHG emissions and resource consumption, drive innovation, and transform our design and business models. By shifting toward circular design and creating products with repair and reuse in mind, we are working to increase value for customers while reducing environmental impacts. We invest in reused, recycled, and sustainably harvested materials and develop innovative ways to repurpose waste materials. In 2023, we used 34,400 tonnes of postconsumer recycled content plastic in HP products—equivalent to 18% of our overall plastic use. Our recovery, repair, reuse, and recycling services help keep our products in use for as long as possible and strive to recover materials at their highest value when products reach end of use. To catalyze decarbonization within our supply chain, we work with suppliers to set science-based targets, implement energy management systems to increase efficiency, and utilize renewable electricity. Participants in our programs avoided 184,000 tonnes of carbon dioxide equivalent (CO2e) emissions and saved 36 million kWh (US4.7 million) in 2023. GHG emissions associated with product energy use equaled 6,656,000 tonnes of CO 2e in 2023—34% of our overall carbon footprint. To decrease water use at our facilities, we employ sustainable landscaping, infrastructure upgrades, leak monitoring and detection, and graywater reuse. At some locations, we reduce our dependency on potable water by utilizing alternative sources, including rainwater and reclaimed water. In 2023, we completed a number of projects to reduce water use, including: • Kiryat Gat, Israel: We deployed 31 new AI-enabled water management meters, which detect anomalies in water usage and alert our team to potential issues. The site's total water consumption is now constantly monitored, and the system has identified multiple leaks before they caused serious damage and water waste. This manufacturing site is designated by the WRI as a site with extremely high water stress, making responsible water management especially important.

(5.9) What is the trend in your organization’s water-related capital expenditure (CAPEX) and operating expenditure (OPEX) for the reporting year, and the anticipated trend for the next reporting year?

(5.9.1) Water-related CAPEX (+/- % change)

-56

(5.9.2) Anticipated forward trend for CAPEX (+/- % change)

397

(5.9.3) Water-related OPEX (+/- % change)

9

(5.9.4) Anticipated forward trend for OPEX (+/- % change)

20

(5.9.5) Please explain

In 2022: HP's water-related OPEX included monitoring and leak detection software and amounted to 127,000. HP’s water-related CAPEX amounted to 455,000 and included expanding monitoring and leak detection and implementing a cooling tower water recycling system. In 2023: HP's water-related OPEX included monitoring and leak detection software and amounted to 138,000. HP implemented a water submetering project and a cooling tower soft water treatment project. Total water related CAPEX was 201,000. In 2024: HP’s water-related OPEX includes monitoring and leak detection software fees, and a well water monitoring project and amounted to 165,000. HP’s water-related CAPEX includes a water storage project, cooling tower sand filter backflush modifications, additional water meters and leak detection, a design for a cooling tower soft water treatment system, stormwater collection system, high efficiency RO skids and well water monitoring. Total water related CAPEX will be 999,000.
[Fixed row]

(5.10) Does your organization use an internal price on environmental externalities?

(5.10.1) Use of internal pricing of environmental externalities

Select from:

☑ No, but we plan to in the next two years

(5.10.3) Primary reason for not pricing environmental externalities

Select from:

☑ Lack of internal resources, capabilities, or expertise (e.g., due to organization size)

(5.10.4) Explain why your organization does not price environmental externalities

While we do not currently price environmental externalities, we are committed to sustainability and continuously evaluate our practices. Accurately pricing environmental externalities is a complex task that requires specialized expertise and systems. We are in the process of building the necessary infrastructure to support such initiatives in the future.

Climate change

(5.11.2.1) Supplier engagement prioritization on this environmental issue

Select from:

☑ Yes, we prioritize which suppliers to engage with on this environmental issue

(5.11.2.2) Criteria informing which suppliers are prioritized for engagement on this environmental issue

Select all that apply

☑ In line with the criteria used to classify suppliers as having substantive dependencies and/or impacts relating to climate change

☑ Leverage over suppliers

☑ Procurement spend

☑ Product lifecycle

(5.11.2.4) Please explain

HP actively collaborates with suppliers to improve their environmental performance. This includes providing training, resources, and tools to help suppliers meet HP's stringent environmental standards. HP also works with suppliers to set environmental goals and monitor progress. HP prioritizes supplier engagement on climate action based on their impact on HP's Scope 3 emissions in line with our classification of supplier climate impact. We engage most closely with suppliers that have the highest emissions impact on Scope 3 upstream emissions starting with suppliers making up at least 95% of production procurement spend, however we engage all contracted HP suppliers through our Supplier Code of Conduct. Impact on Scope 3 emissions is determined through both the general uses of spend as proxy for impact (and influence) as well as through use of product LCA analysis to identify suppliers of high impact commodities. We also engagement closely with the suppliers that assemble our finished products (such as personal systems and print hardware and supplies), due to both the degree of influence we have and also the expectations of our stakeholders to address impacts closest to HP in our supply chain. Additionally, some suppliers are prioritized due to their relative impact on individual HP business units or products/categories like inkjet print cartridges or HP's Indigo business unit.

Water

(5.11.2.1) Supplier engagement prioritization on this environmental issue

Select from:

☑ Yes, we prioritize which suppliers to engage with on this environmental issue

(5.11.2.2) Criteria informing which suppliers are prioritized for engagement on this environmental issue

Select all that apply

☑ In line with the criteria used to classify suppliers as having substantive dependencies and/or impacts relating to water

☑ Procurement spend

(5.11.2.4) Please explain

HP prioritizes suppliers for engagement on water issues, in ways which are in line with our approach to classifying suppliers with substantive impacts/dependencies. We start with production procurement spend which is a robust proxy both for environmental impacts as well as for our degree of influence. Suppliers in our top 95% of procurement spend are cross-referenced for geographic water risk using WRI Aqueduct and WWF's Water Risk Filter for water risk "high" or greater. The threshold for suppliers' water dependency is based on an HP's internal analysis of high water dependence for type of product/commodity manufactured and the threshold for impact on water availability is based on internal analysis of suppliers' water intensity reported to HP through response to our CDP Supply Chain Water Security request. Supplier impact on water quality and provision of WASH services is shown through conformance to HP's Supplier CoC. Because of this prioritization, suppliers for product lines with components that have higher water impacts or dependence on water are more likely to be engaged.

(5.11.6.12) Comment

All of HP suppliers are expected to comply with HP's Supplier Code of Conduct (SCoC). The SCoC includes wide ranging environmental requirements, including the requirement to publicly report Scope 1 & 2 GHG emissions. HP's supplier assurance program evaluates supplier compliance to the SCoC and includes corrective action as needed. To enable compliance to this requirement, we request 98% of production suppliers by spend to disclose emissions and other climate data through HP's membership in the CDP SC program – and specifically request emission reporting – and we follow up with suppliers to both drive a high response rate and to improve the quality of reporting, escalating through procurement teams, if needed. Our annual internal objective is to have 95% of production suppliers by spend disclose GHG emissions data to HP. 100% of suppliers that are evaluated through HP's SCoC Assurance Program and/or HP's Supplier Sustainability Scorecard Program and found non-compliant are engaged to promote future compliance.

HP suppliers must provide workers with ready access to clean toilet facilities, potable water and sanitary food preparation and, where applicable, with hot water for bathing and showering, suppliers. This is included in contracts with suppliers. HP reviews supplier compliance with these requirements through supplier self-assessments, third-party audits. Non-compliance is managed through both HP’s assurance program which includes time-bound corrective action plans and review of improvements needed.

(5.11.6.12) Comment

HP requires strategic suppliers to set and publish science-based targets for GHG reduction. Since 2014, HP has required suppliers to set climate-related goals, and HP was the first IT company to set (in 2014) and achieve a supply chain GHG reduction goal and among the earliest companies to set a SBTi-validated target. We expect our suppliers to take ownership of managing their climate impacts by setting public GHG goals, and in 2018 we began requiring strategic suppliers to set science-based targets. We require 46% of suppliers by production procurement spend to set SBTs through sustainability scorecards, executive communications, and/or procurement teams' supplier management reviews. We require these goals to be public and reported to HP. We review and analyze goals published in CDP responses through HP's CDP Supply Chain membership and suppliers' sustainability reports. Additionally, we encourage suppliers to have their goals 3rd-party validated by the SBTi. As of 2023, 51% reported science-based targets (39% validated by the SBTi and 12% evaluated by HP).100% of suppliers required to comply and found non-compliant are engaged to promote future compliance.

(5.11.7.9) Describe the engagement and explain the effect of your engagement on the selected environmental action

Coinciding with the COP28 UN Climate Change Conference, HP became a founding sponsor of Catalyze in October 2023. This program, led by Schneider Electric, is designed to foster industrywide collaboration to tackle GHG emissions from the semiconductor and broader IT industry supply chains. Participants receive training on renewable energy and renewable energy sourcing, including local/market-specific information. They are also encouraged to commit to decarbonization and to collectively drive procurement of renewable energy, including by using the purchasing power of buyer cohorts to provide suppliers—who may not have the capacity on their own—with access to large-scale power purchase agreements (PPAs). We have offered this highly-scalable program to 98% of suppliers by production procurement spend as well as to strategic suppliers of smaller business units and of logistics services. Our directly contracted suppliers are also enabled to invite their *suppliers to participate. Because we collaborated with peers in the semiconductor industry who are also our suppliers and our suppliers' suppliers, this engagement already includes at least tier 2 suppliers (to be extremely conservative we are only reporting the three tier 2 suppliers in this row that are our co-sponsors of this program). Positive Outcomes & Description of Impact According to Measure of Success: Suppliers gaining knowledge of and access to renewable electricity sourcing enables both the actual sourcing of renewable electricity by suppliers and visibility to the reduction pathway needed for them to set ambitious climate goals like science based GHG reduction targets. Quantitative Threshold/Criteria for Measuring Success: This engagement will be successful if there is an increase in suppliers (in any tier) participating to gain knowledge about renewable electricity sourcing and therefore enabled to source renewables and reduce their own Scope 2 GHG emissions as well as HP's Scope 3 upstream GHG emissions.*

(5.11.7.9) Describe the engagement and explain the effect of your engagement on the selected environmental action

HP’s Supplier Sustainable Impact Scorecard is integrated into our procurement process and used to measure and incentivize supplier performance on a range of social and environmental factors, including our requirement for all contracted suppliers to provide WASH services to all employees (which is included in contracts as part our Supplier Code of Conduct). Suppliers who have exceptional performance in Scorecard realize a benefit in their commercial relationship with HP. Results are summarized across multiple dimensions and contribute to a supplier’s overall procurement score, which impacts the supplier’s relationship with HP and ongoing business. Suppliers discuss their Scorecard with HP as part of regular business performance evaluations throughout the year, and receive additional points if they demonstrate sustained improvement. Positive Outcomes: As we work with new and existing suppliers through our Scorecard program, we ensure that employees in our supply chain have access to WASH services. Criteria for Measuring Success: We measure success through suppliers’ Scorecard scores, both for individual suppliers as they make improvements and corrects, and in aggregate across our supply chain. During 2023, average scores for final assembly suppliers increased by one percentage point compared to 2022, and average scores for commodity suppliers decreased by six percentage points.

Sustainability is a key IT sales differentiator. Increasingly, it is a mandatory criteria for IT tenders—customers want to purchase products with sustainability attributes from trusted HP partners, and those partners want to build sustainable businesses and earn loyal customers. In 2023, we expanded HP Amplify Impact to 48 countries. Now, more than 3,900 partners representing over 80% of HP channel partner revenue are enrolled and benefiting from this world-class program. We are on track to reach our objective of enrolling at least 50% of channel partners by 2025. To support channel partners on their journey, Amplify Impact includes: • A sustainability self-assessment and personalized comprehensive report, which provides partners with actionable insights, industry best practices, and resources, including peer-to-peer comparison. Ninety percent of partners report they highly value the personalized recommendations. • The Amplify Impact Hub, offering customized sustainability support with 25 initiatives, trainings, consultancy, and personalized tracking to drive our partners' sustainability sales and impact. • HP University, which offers a comprehensive sustainability sales training curriculum; more than 1,800 Amplify Impact partners have completed over 119,000 HP training courses. • Support for partners with sustainability bids from the HP Sustainability and Compliance Center and exclusive sales support materials. The program gives channel partners the tools to develop their sustainability expertise and strategy and promote their achievements using exclusive marketing materials and social media kits. In May 2024, we extended the program to distribution partners.

(5.11.9.6) Effect of engagement and measures of success

Amplify Impact has received industry recognition and several awards, including CRN's Global Flagship Award—Sustainability Vendor of the Year 2024. The program was a finalist for the 2023 World Sustainability Awards, was a 2021 Silver Stevie Winner and also won the 2021 Channel Innovation Award for Partner Program of the Year. 66% of partners report that the program has helped improve their win rate of sustainability deals, and 80% of partners expressed a high rate of satisfaction with the HP Amplify Impact Program

In May 2024, we extended the program to distribution partners. Amplify Impact has received industry recognition and several awards, including CRN's Global Flagship Award—Sustainability Vendor of the Year 2024. The program was a finalist for the 2023 World Sustainability Awards, was a 2021 Silver Stevie Winner and also won the 2021 Channel Innovation Award for Partner Program of the Year. 66% of partners report that the program has helped improve their win rate of sustainability deals, and 80% of partners expressed a high rate of satisfaction with the HP Amplify Impact Program.

Climate change

(5.11.9.1) Type of stakeholder

Select from:

☑ Investors and shareholders

(5.11.9.2) Type and details of engagement

Education/Information sharing

☑ Share information on environmental initiatives, progress and achievements

(5.11.9.3) % of stakeholder type engaged

Select from:

☑ 26-50%

(5.11.9.4) % stakeholder-associated scope 3 emissions

Select from:

☑ Unknown

(5.11.9.5) Rationale for engaging these stakeholders and scope of engagement

As a publicly traded company, if our ESG practices, including those related to climate change, do not meet evolving investor or other stakeholder expectations and standards, then our reputation or our attractiveness as an investment, business partner, acquiror, service provider or employer could be negatively impacted. We gain valuable insight through regular engagement with a range of stakeholders, including employees, investors, suppliers, customers, peer companies, public policymakers, industry bodies, nongovernmental organizations (NGOs), sector experts, and others. These interactions build our collective intelligence, help us prioritize critical issues, and provide insights into emerging opportunities and risks. We consider input from customers, NGOs, employees, investors, and others in the preparation of our annual Sustainable Impact Report. In 2024, prior to filing our latest Proxy Statement, we conducted our annual outreach regarding our governance profile with stockholders representing around 30% of our outstanding stock. Topics discussed included HP's strategy and business performance, governance practices, executive compensation, and ESG and sustainable impact. In addition, our Sustainable Impact Report and CDP Responses (including our response to climate-change related items) are published annually to inform stakeholders like our investors and potential investors – notably, according to CDP, in 2023 HP was requested to respond to CDP Climate Change by the CDP Capital Markets campaign by over 745 financial institutions with US136 trillion of assets. And HP collaborates with some of those investors to drive climate ambition in our supply chain and beyond by participating in the CDP Science-Based Targets Campaign annually since 2021. By cosigned a letter to a large number of companies—including many in our supply chain—urging them to set SBTi-validated GHG emissions–reduction goals.

(5.11.9.6) Effect of engagement and measures of success

By engaging with investors, we ensure that current and potential investors have insights into HP's climate change associated risks and opportunities, as well as gaining insights into our investors' expectations. If our ESG practices, including those related to climate change, do not meet evolving investor or other stakeholder expectations and standards, then our reputation or our attractiveness as an investment, business partner, acquiror, service provider or employer could be negatively impacted. By collaborating with investors, we are able mutually amplify our influence over supply chains. Our collaboration with investors in the 2023 CDP Science-Based Targets Campaign resulted in 99 companies joining SBTi (representing 220 million tonnes of CO2e emissions annually) by making commitments to set near-term targets and/or net zero targets through SBTi. Through this initiative, HP influences high-impact companies beyond our first tier, including sub-tier suppliers in industries such as chemicals and metals, where our influence is limited.

C6. Environmental Performance - Consolidation Approach

(6.1) Provide details on your chosen consolidation approach for the calculation of environmental performance data.

Climate change

(6.1.1) Consolidation approach used

Select from:

☑ Operational control

(6.1.2) Provide the rationale for the choice of consolidation approach

HP uses the operational control approach for calculating environmental performance data to focus on areas where it can directly influence and manage environmental impacts. This approach includes data from all facilities and operations where HP has authority over policies and activities. By using operational control, HP ensures it reports consistently across all operations where it can implement changes, aligning with global standards like the GHG Protocol.

Water

(6.1.1) Consolidation approach used

Select from:

☑ Operational control

(6.1.2) Provide the rationale for the choice of consolidation approach

HP uses the operational control approach for calculating environmental performance data to focus on areas where it can directly influence and manage environmental impacts. This approach includes data from all facilities and operations where HP has authority over policies and activities. By using operational control, HP ensures it reports consistently across all operations where it can implement changes, aligning with global standards like the GHG Protocol

[Fixed row]

C7. Environmental performance - Climate Change

(7.1) Is this your first year of reporting emissions data to CDP?

Select from:
☑ No

(7.1.1) Has your organization undergone any structural changes in the reporting year, or are any previous structural changes being accounted for in this disclosure of emissions data?

(7.1.1.1) Has there been a structural change?

Select all that apply
☑ Yes, an acquisition

(7.1.1.2) Name of organization(s) acquired, divested from, or merged with

HP acquired Poly.

(7.1.1.3) Details of structural change(s), including completion dates

The Poly sites that are retained by HP Inc have been included in the 2023 operational boundary. These acquisitions did not yield 5% impact to the existing Scope 1 and Scope 2 MBM carbon footprint so rebaselining was not required.
[Fixed row]

(7.1.2) Has your emissions accounting methodology, boundary, and/or reporting year definition changed in the reporting year?

(7.1.2.1) Change(s) in methodology, boundary, and/or reporting year definition?

Select all that apply

☑ Yes, a change in methodology

☑ Yes, a change in boundary

(7.1.2.2) Details of methodology, boundary, and/or reporting year definition change(s)

Change in methodology: Our emissions accounting calculations reflect several methodological updates to improve the accuracy of our carbon footprint calculations and to align with our 2030 GHG emissions–reduction goal. These include: • Personal systems: We switched from maximum to typical configuration, to better represent the average product our customers buy. This primarily impacts the manufacturing and use phases. • Printers: We improved the calculation engine that we use to better represent HP printer–related GHG emissions, and increased the percentage of our products that were directly assessed using life cycle assessments (LCAs). • Supplies: We updated the calculation model to better reflect current technology and added new representative LCA groups to the calculation. • Accessories: We developed LCA models to enable inclusion of GHG emissions associated with accessories in our footprint calculations. Based on these updates to our methodology, we have recalculated GHG emissions data for our 2019 baseline, 2020, 2021, and 2022, for comparability. These methodological updates impact Scope 3 categories 1, 4, 9, 11, and 12. Change in boundary: In 2023, we began developing new LCA tools to report on Scope 3 accessories, which grew in volume following our acquisitions of Poly in 2022 and HyperX in 2021. These LCAs will address products including HyperX gaming accessories and Poly video and voice solutions.

[Fixed row]

(7.1.3) Have your organization’s base year emissions and past years’ emissions been recalculated as a result of any changes or errors reported in 7.1.1 and/or 7.1.2?

(7.1.3.1) Base year recalculation

Select from:

☑ Yes

(7.1.3.2) Scope(s) recalculated

Select all that apply

☑ Scope 3

(7.1.3.3) Base year emissions recalculation policy, including significance threshold

The Poly sites that are retained by HP Inc have been included in the 2023 operational boundary. These acquisitions did not yield 5% impact to the existing Scope 1 and Scope 2 MBM carbon footprint so rebaselining was not required. Scope 3 emissions were recalculated for previous years and base year (See 7.1.2). Based on these updates to our methodology, we have recalculated GHG emissions data for our 2019 baseline, 2020, 2021, and 2022, for comparability. These methodological updates impact Scope 3 categories 1, 4, 9,11, and 12.

(7.1.3.4) Past years' recalculation

Select from:

☑ Yes

[Fixed row]

(7.2) Select the name of the standard, protocol, or methodology you have used to collect activity data and calculate emissions.

Select all that apply

☑ Defra Environmental Reporting Guidelines: Including streamlined energy and carbon reporting guidance, 2019

☑ The Greenhouse Gas Protocol: A Corporate Accounting and Reporting Standard (Revised Edition)

☑ The Greenhouse Gas Protocol: Scope 2 Guidance

☑ The Greenhouse Gas Protocol: Corporate Value Chain (Scope 3) Standard

(7.3) Describe your organization's approach to reporting Scope 2 emissions.

(7.3.1) Scope 2, location-based

Select from:

☑ We are reporting a Scope 2, location-based figure

(7.3.2) Scope 2, market-based

Select from:

☑ We are reporting a Scope 2, market-based figure

(7.3.3) Comment

For 2023, HP reported Scope 2 emissions using both the Location-based and Market-based methods in accordance with WRI's Greenhouse Gas Protocol inclusive of the January 2015 Scope 2 Guidance. HP's overall electricity consumption reported in the market-based method utilizes WRI's hierarchy of emission factor assignment: applying contractual instruments, supplier specific emission factors where provided by vendors, residual mixes for markets where available, and lastly using regional or national grid factors for the balance of the portfolio where the aforementioned factors are not available. Under the Location-Based method, only regional and national grid mixes are utilized, and renewable energy has no effect or benefit to emission figures. Residual mix note: for countries where a residual mix was not available, emissions were calculated using grid averages, which may result in double counting of voluntary purchases of renewable energy between electricity consumers.
[Fixed row]

(7.4) Are there any sources (e.g. facilities, specific GHGs, activities, geographies, etc.) of Scope 1, Scope 2 or Scope 3 emissions that are within your selected reporting boundary which are not included in your disclosure?

Select from:
☑ No

(7.5) Provide your base year and base year emissions.

Scope 1

(7.5.1) Base year end

10/31/2015

(7.5.2) Base year emissions (metric tons CO2e)

66900.0

(7.5.3) Methodological details

For 2023, HP reported Scope 1 emissions in accordance with WRI's Greenhouse Gas Protocol. For fuel consumption, emission factors were sourced from the US Environmental Protection Agency (EPA). Refrigerant emissions utilized emission factors from the Intergovernmental Panel on Climate Change Sixth Assessment Report (IPCC AR6) where available. Refrigerants for which AR6 emission factors were not available were assigned emission factors sourced from the US EPA, which uses as reference IPCC AR4.

Scope 2 (location-based)

(7.5.1) Base year end

10/31/2015

(7.5.2) Base year emissions (metric tons CO2e)

298200.0

(7.5.3) Methodological details

For 2023, HP reported Scope 2 emissions using both the Location-based and Market-based methods in accordance with WRI's Greenhouse Gas Protocol inclusive of the January 2015 Scope 2 Guidance. HP's overall electricity consumption reported in the market-based method utilizes WRI's hierarchy of emission factor assignment: applying contractual instruments, supplier specific emission factors where provided by vendors, residual mixes for markets where available, and lastly using regional or national grid factors for the balance of the portfolio where the aforementioned factors are not available. Under the Location-Based method, only regional and national grid mixes are utilized, and renewable energy has no effect or benefit to emission figures. Scope 2 (market-based)

(7.5.1) Base year end

10/31/2015

(7.5.2) Base year emissions (metric tons CO2e)

321800.0

(7.5.3) Methodological details

For 2023, HP reported Scope 2 emissions using both the Location-based and Market-based methods in accordance with WRI's Greenhouse Gas Protocol inclusive of the January 2015 Scope 2 Guidance. HP's overall electricity consumption reported in the market-based method utilizes WRI's hierarchy of emission factor assignment: applying contractual instruments, supplier specific emission factors where provided by vendors, residual mixes for markets where available, and lastly using regional or national grid factors for the balance of the portfolio where the aforementioned factors are not available. Under the Location-Based method, only regional and national grid mixes are utilized, and renewable energy has no effect or benefit to emission figures. Residual mix note: for countries where a residual mix *was not available, emissions were calculated using grid averages, which may result in double counting of voluntary purchases of renewable energy between electricity consumers.*

Scope 3 category 1: Purchased goods and services

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

14606731

(7.5.3) Methodological details

HP uses separate LCA methods to calculate GHG emissions that represent more than 99% of HP product units shipped each year associated with the following product categories: Personal systems, including HP desktops, notebooks, workstations, displays, thin clients, tablets/slates, mobile computing devices, all-inone computers, retail point-of-sale units and accessories (Poly, HyperX and HP Branded). - HP branded accessories: Pointing Devices, Adapters, Bags and Cases, Keyboard, Physical Security, Headsets, Optical, Docking Accessories, Drives and Memories, Cables, Connectors and Miscellaneous. - HyperX: Headsets, Microphones, Keyboards, Mice and Miscellaneous. - Poly: Headsets, Voice, Video Systems and other Poly Accessories. Printing, including HP LaserJet, Inkjet, PageWide, DesignJet, Indigo, and Scitex printers, PageWide presses, scanners, Jet Fusion 3D printers and Supplies (including LES, Inkjet and PWA). Personal Systems product LCAs are generated using an LCA tool hosted by the GaBi Envision software and supported by an underlying GaBi model which was developed by Sphera Solutions Inc., in conformance with the ISO 14040/44 standards. This Personal Systems LCA tool allows for updated and refined LCA modelling based on HP-specific parameters. The inputs to the Personal Systems LCA tool include such things as product and component attributes, product energy use and transport information, many of which can be found on the product data sheets. To calculate its overall personal systems PCF, HP uses the Personal Systems LCA tool to conduct PCFs for more than 95% of its commercial systems products by sales. These results are extrapolated to the volumes of 99% of HP consumer and commercial personal systems products shipped during the reporting year. HP personal systems products comprising the PCF calculations include notebooks, desktops, displays, all-in-ones, workstations, thin clients and tablets. Product models below contribution threshold of 2.5% of total shipping are not considered in the calculation due the availability of lifecycle information and the estimated immateriality of associated emissions. Printer LCAs for Inkjet, PageWide, DesignJet, and LaserJet products are prepared in conformance with ISO14040/14044 by Sphera Solutions, Inc. The LCA for the HP Jet Fusion 3D printer was prepared by EarthShift Global. For more detail, please see HP's 2023 Carbon Accounting Manual at https://h20195.www2.hp.com/v2/GetDocument.aspx?docnamec08951351

Scope 3 category 2: Capital goods

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

233345

(7.5.3) Methodological details

Capital expenditures are identified on HP’s balance sheet; generally, additions to the Property, Plant, and Equipment (PP&E) represents the annual investment in capital goods by HP. Leased furniture and equipment are included within this category, while any capital expenditure deemed as work in progress is excluded. Emissions factors come from USEEIO v1.2 database.

Scope 3 category 3: Fuel-and-energy-related activities (not included in Scope 1 or 2)

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

57694

(7.5.3) Methodological details

This category accounts for all the upstream emissions associated with the energy purchased by HP (Scope 1) and electricity consumed by HP (Scope 2) for facilities under our operational control and as defined by the boundary for Scope 1 and 2 emissions. This category excludes emissions from the combustion of fuels or electricity consumed by the Company, since they are already included in Scope 1 or Scope 2. A total factor of 22% is applied to estimate the upstream impacts and is based on transmission and distribution losses. Plant use losses and Location-Based Methods emissions associated with Scope 2 emissions are used to calculate this category.

Scope 3 category 4: Upstream transportation and distribution

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

508645

(7.5.3) Methodological details

This category is calculated using the methods described for Category 1 (Purchased Goods and Services) and is considered together with Category 9 for downstream transportation. Current LCA tools allow reporting of upstream and downstream data aggregated. Please see HP's 2023 Carbon Accounting Manual at https://h20195.www2.hp.com/v2/GetDocument.aspx?docnamec08951351

Scope 3 category 5: Waste generated in operations

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

383

(7.5.3) Methodological details

The total non-hazardous waste activity across HP is reported in the annual Sustainable Impact Report. An emissions factor determined by the U.S. Environmental Protection Agency's (EPA) Waste Reduction Model (WARM) is used to convert this to GHG emissions. A portion of non-hazardous waste is diverted from the waste stream and reused; emissions from this portion are not considered a conservative approach. The emissions associated with processing hazardous waste is assumed to be de minimis given the low relative volumes and comprehensive management practices HP has in place as described in HP's Sustainable Impact Report and target.

Scope 3 category 6: Business travel

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

68770

(7.5.3) Methodological details

Using the UK Department of Energy, Food and Rural Affairs (DEFRA) methodology, for air travel, the estimation takes into account the type of aircraft, passenger load, cabin class and miles travelled for each ticketed purchase. For rail, the estimation considers the miles travelled and the rail supplier information, to apply the emissions factors for rail (Eurostar versus everyone else). HP includes emissions from commercial air and rail travel but excludes emissions relating to car rental and hotel stays since the data is currently not available. Emissions from transportation in vehicles owned or controlled by HP are accounted for in Scope 1 (for fuel use). HP takes Sustainable Aviation Fuel purchases into consideration in our total business travel emissions by deducting the positive impact from overall business travel emissions.

Scope 3 category 7: Employee commuting

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

194210

(7.5.3) Methodological details

Assumptions for commute distance, vehicle type and number of working days for employees are based on badge data and the latest U.S. National Household Travel Survey. Emissions factors for the conversion of gasoline and other fuel types to carbon dioxide equivalents are obtained from the EPA’s Greenhouse Gas Equivalencies and the IPCC Mobile Consumption document. For remote work the household emissions for an eight-hour workday are calculated by using the average U.S. household energy per day times the IEA worldwide electricity conversion factor of 464.1 grams of CO2 per kWh.

Scope 3 category 8: Upstream leased assets

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

0.0

(7.5.3) Methodological details

This category covers emissions from the operation of assets leased by the company (as the lessee) and not included in Scope 1 or Scope 2. Since HP primarily leases office space rather than owning industrial assets or equipment, these emissions are usually included in Scope 1 or 2, and Category 8 is not relevant.

Scope 3 category 9: Downstream transportation and distribution

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

0.0

(7.5.3) Methodological details

Category 9 accounts for downstream transportation and distribution emissions related to our channel partners delivering HP products to the end consumer. We estimated the average distance for product delivery by channel partners as 300 km, which corresponds to less that 5% than the overall distance associated with upstream transportation (Category 4). Furthermore, we considered the routes and transportation methods currently applied for worldwide HP product shipping. Using the above reported information and applying the EFs related to the different transportation routes (air, ocean, rail, road), we estimated that Scope 3 Category emissions to be 4% of Scope 3 Category 4 emissions, making this category not relevant.

Scope 3 category 10: Processing of sold products

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

0

(7.5.3) Methodological details

This category involves emissions from the processing of intermediate products sold by the company by third parties (e.g., suppliers or customers). HP sells finished products (such as computers, printers, and related accessories) that do not require further processing by third parties, making Category 10 inapplicable.

Scope 3 category 11: Use of sold products

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

10970021

(7.5.3) Methodological details

This category is calculated using the methods described for Category 1 (Purchased Goods and Services). For more information, please see HP's 2023 Carbon Accounting Manual at https://h20195.www2.hp.com/v2/GetDocument.aspx?docnamec08951351

Scope 3 category 12: End of life treatment of sold products

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

364172

(7.5.3) Methodological details

This category is calculated using the methods described for Category 1 (Purchased Goods and Services). For more information, please see HP's 2023 Carbon Accounting Manual at https://h20195.www2.hp.com/v2/GetDocument.aspx?docnamec08951351

Scope 3 category 13: Downstream leased assets

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

11884

(7.5.3) Methodological details

Purpose The purpose of this methodology is to calculate the emissions from assets leased to third parties. This includes the operation of assets leased by the reporting company in the reporting year and not included in Scope 1 and Scope 2 emissions. Boundary • Includes: Square footage reported by HP as leased to third parties. It is assumed that these facilities are outside of HP's operational control and not included in HP's Scope 1 or 2 emissions. • Excludes: Only real estate is included here. If HP leases any other assets, they are likely to be minimal to the overall footprint. HP leased equipment under DaaS (Device as a Service) or MSP (Managed Service Provider) are accounted for in the ship volume of each business group. Data Sources • Amount of leased space: Summary found in HP 10k for the reporting year. • Emissions factors: From the US Department of Energy and based on CBECs (Commercial Buildings Energy Consumption Survey) data.

Scope 3 category 14: Franchises

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

0.0

(7.5.3) Methodological details

This category pertains to emissions from franchise operations. HP does not operate under a franchising business model, so it does not have emissions associated with franchises, making Category 14 irrelevant.

Scope 3 category 15: Investments

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

2260

(7.5.3) Methodological details

Purpose To calculate Scope 3 Emissions from Investments. This category includes operations of investments (including equity and debt investments and project finance) in the reporting year, not included in scope 1 or scope 2. Boundary Corporate Investments performed by HP during the current FY and reflected in data sources. Data Sources From the FY 10-K "Corporate Investments": Total revenue from investments made by HP during the current fiscal year. Emission Factor Category 15 Investments is calculated by using an estimated emissions factor from USEEIO v1.2 Investment Banking and Securities Dealing (2017 NAICS Code523110).

Scope 3: Other (upstream)

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

3000000.0

(7.5.3) Methodological details

Together with the Responsible Business Alliance (formerly the Electronic Industry Citizenship Coalition or EICC)), HP developed the RBA Online environmental reporting system, a standard approach to measuring and reporting carbon emissions in the global electronics supply chain. It is based on global standards such as the WRI Greenhouse Gas Protocol and CDP. In 2016 HP joined the CDP Supply Chain Program to deepen our engagement with direct and indirect suppliers and to support cross-industry best reporting practices. In 2019, HP asked suppliers to report and share emissions data with their customers in a standardized questionnaire including quantitative GHG emissions and energy data, as well as qualitative information on carbon and energy management practices. Emissions are calculated based on suppliers' reported emissions and their dollar volume of HP's business compared to their total revenue. The majority of these companies report on a calendar-year basis. Data reported here reflects extrapolation to 100% of first-tier production suppliers. Data collected for 2019 represented 95% of HP production spend. This data differs from the product life cycle assessment-based estimates for materials extraction through manufacturing (also called Purchased Goods and Services), which are based on a different calculation methodology and use a combination of HP-specific and industry data. The emissions for Purchased Goods and Services are reported as separate line items, but should not be added together to avoid double counting. Data reported above in "Purchased goods and services" is calculated through LCA based analysis to capture the complete supply chain from cradle-to-gate. LCA-based data and primary supplier data reported here are difficult to compare. The emissions are reported as separate line items, but should not be added together to avoid double counting.

Scope 3: Other (downstream)

(7.5.1) Base year end

10/31/2019

(7.5.2) Base year emissions (metric tons CO2e)

1250000.0

(7.5.3) Methodological details

These figures for transport GHG emissions are based on data reported by logistics service providers (LSP) that HP contracts to deliver our products. They differ from the larger product life cycle assessment-based estimate, which includes additional upstream and downstream transport related to our products, as well as retail and storage. These data do not include data from all recent HP Co. acquisitions. We partner with our LSPs to develop our global transportation CO2e footprint. Each of our LSPs calculates the CO2e emissions for all the freight they move on behalf of HP. These CO2e reports are consolidated to give us an "estimated" global CO2 footprint. The LSPs use methodologies from SmartWay, EcoTransit, Clean Cargo, WRI Greenhouse Gas (GHG) Protocol and the new Global Logistics Emissions Council (GLEC) Framework (recently adopted by CDP) to produce their individual reports. Our LSPs have their tools/methodologies validated by a third-party company as well. HP also uses Ernst and Young to validate our own Scope 3 emissions (including Transport). We are one of few companies of our size to demonstrate transparency with our global CO2e transportation footprint (available since 2008). Starting in FY18 HP transitioned to the new Global Logistics Emissions Council (GLEC) Framework. This improved methodology incorporates actual fuel usage to existing calculations to enhance the granularity of data for CO2 calculations. HP was one of the pioneers in this process, managed by the Smart Freight Centre. This methodology has been approved and accepted by the CDP and the World Resource Institutes Green House Gas Protocol as an additional industry wide calculation process. Data reported above in "Purchased goods and services" is calculated through LCA based analysis to capture the complete supply chain from cradle-to-gate. LCA-based data and primary supplier data reported here are difficult to compare. The emissions are reported as separate line items, but should not be added together to avoid double counting.

(7.8.5) Please explain

HP utilizes The GHG Protocol Corporate Value Chain (Scope 3) Accounting and Reporting Standard for Scope 3 emissions reporting. In addition, HP uses Lifecycle analysis (LCA) tools to calculate product-related impacts. An LCA evaluates all stages of a product’s life using an inventory of relevant energy and material inputs and environmental releases. LCAs are designed to provide the total product carbon footprint (PCF) and a percentage breakdown of where the emissions occurred based on the categories of manufacture, transport, use, and end-of-life. HP has conducted LCAs and PCFs of hundreds of products over the last several years, spanning our product portfolio. HP uses different methods or models to calculate LCAs for the various types of products. Separate calculations and models that use HP specific information have been used and created for HP brand paper manufacturing and non-production supplier emissions (a portion of Category 1) and non-product related Scope 3 categories (Categories 2, 3, 5-8 and 13-15). HP also annually collects supplier CO2e emissions data directly from production suppliers through the CDP Supply Chain program and the Responsible Business Alliance’s RBA Online, and follows up with supplier personnel to enhance data accuracy. Our supplier emissions data covered 95% of our first-tier production suppliers (by spend), extrapolated to 100% in 2022, the most recent year that data is available. Total emissions of these suppliers during 2022 equaled 2,900,000 metric tonnes CO2e. These supplier emissions are allocated to HP based on suppliers' dollar volume of HP business compared with their total revenue. Primary data from suppliers is reported additionally in "Other: Upstream" below. Due to the nature of the LCA based analysis used to capture the complete supply chain from cradle-to-gate for this category, it is difficult to compare the primary data to the calculated total. The emissions are reported as separate line items, but should not be added together to avoid double counting.

(7.8.5) Please explain

The calculation methodology for all LCAs encompasses the following Scope 3 categories: 1 Purchased Goods and Services, 4 and 9 for Transportation; 11 for Use of Sold Products; 12 for End-of-Life Treatment of Sold Products. HP also provides data reported by logistics service providers (LSP) that HP contracts to deliver our products. They differ from the larger product life cycle assessment-based estimate, which includes additional upstream and downstream transport related to our products, as well as retail and storage. Our global CO2e footprint from our logistic service providers for 2023 was approximately 960,000 metric tonnes CO2e. This is reported additionally in "Other: Downstream" category below. Due to the nature of the LCA based analysis used to capture the complete transportation emissions for this category, it is difficult to compare the primary data to the calculated total. The emissions are reported as separate line items (see Other downstream emissions below) but should not be added together in order to avoid double counting.

Waste generated in operations

(7.8.1) Evaluation status

Select from:

☑ Relevant, calculated

(7.8.2) Emissions in reporting year (metric tons CO2e)

1062

(7.8.3) Emissions calculation methodology

Select all that apply

☑ Other, please specify **:**U.S. Environmental Protection Agency’s (EPA) Waste Reduction Model (WARM)

(7.8.4) Percentage of emissions calculated using data obtained from suppliers or value chain partners

0

(7.8.5) Please explain

The total non-hazardous waste activity across HP is reported in the annual Sustainable Impact Report. An emissions factor determined by the U.S. Environmental Protection Agency’s (EPA) Waste Reduction Model (WARM) is used to convert this to GHG emissions. A portion of non-hazardous waste is diverted from the waste stream and reused; emissions from this portion are not considered at this time which is considered a conservative approach. The emissions associated with processing hazardous waste is assumed to be de minimis given the low relative volumes and comprehensive management practices HP has in place as described in HP’s Sustainable Impact Report and Environment, Health and Safety Policy. For more information, see HP Carbon Accounting Manual at https://h20195.www2.hp.com/v2/GetDocument.aspx?docnamec08951351

Business travel

☑ Distance-based method

(7.8.4) Percentage of emissions calculated using data obtained from suppliers or value chain partners

100

(7.8.5) Please explain

HP’s global travel agency provides values that take into account the type of aircraft, passenger load, cabin class, and miles traveled for each ticketed trip. This data also includes rail travel carriers and distance traveled. Although these values fall below our quantitative reporting threshold of 0.25% of total Scope 3 emissions and could be reported as de minimis, we choose to report this category due to our ability to directly track this data.. We used UK Department of Energy, Food and Rural Affairs (DEFRA) methodology. For more information, see HP Carbon Accounting Manual at https://h20195.www2.hp.com/v2/GetDocument.aspx?docnamec08951351

(7.8.5) Please explain

Together with the Responsible Business Alliance (RBA), HP developed the RBA Online environmental reporting system, a standard approach to measuring and reporting carbon emissions in the global electronics supply chain. It is based on global standards such as the WRI Greenhouse Gas Protocol and CDP. In 2016 HP joined the CDP Supply Chain Program to deepen our engagement with suppliers and to support cross-industry best reporting practices. HP asks suppliers to disclose actual emissions. Through CDP and RBA Online, companies can report and share emissions data with their customers in a standardized questionnaire including quantitative carbon emissions and energy data, as well as qualitative information on carbon and energy management practices and goals. Supply chain emissions are allocated to HP based on suppliers' dollar volume of HP business compared with their total revenue. This methodology derives an estimated HP supply chain carbon footprint. The reported GHG emissions account for our first-tier final assembly, materials, and components (direct) suppliers as well as non-production (indirect) suppliers of goods and services HP uses for its own operations such as staffing, telecommunications, and travel. Data reported above in "Purchased goods and services" is calculated through LCA based analysis to capture the complete supply chain from cradle-to-gate. LCA-based data and primary supplier data reported here are difficult to compare. The emissions are reported as separate line items but should not be added together to avoid double counting.

(7.8.5) Please explain

These figures for transport GHG emissions are based on data reported by logistics service providers (LSP) that HP contracts to deliver our products. They differ from the larger product life cycle assessment-based estimate, which includes additional upstream and downstream transport related to our products. These data do not include data from all recent HP Co. acquisitions. We partner with our LSPs to develop our global transportation CO2e footprint. Each of our LSPs calculates the CO2e emissions for all the freight they move on behalf of HP Co. These CO2e reports are consolidated to give us an “estimated” global CO2 footprint. The LSPs use methodologies from SmartWay, EcoTransit, Clean Cargo, WRI Greenhouse Gas (GHG) Protocol and the new Global Logistics Emissions Council (GLEC) Framework to produce their individual reports. Our LSPs have their tools/methodologies validated by a third-party company as well. We are one of few companies of our size to demonstrate transparency with our global CO2e transportation footprint (available since 2008). Starting in FY18, HP transitioned to the new Global Logistics Emissions Council (GLEC) Framework. This improved methodology incorporates actual fuel usage with existing calculations to enhance the granularity of data for CO2 calculations. HP was one of the pioneers in this process, managed by the Smart Freight Centre. This methodology has been approved and accepted by the CDP and the World Resource Institutes Green House Gas Protocol as an additional industry wide calculation process. Data reported above in "Purchased goods and services" is calculated through LCA based analysis to capture the complete supply chain from cradle-to-gate. LCA-based data and primary supplier data reported here are difficult to compare. The emissions are reported as separate line items but should not be added together to avoid double counting.

(7.10.1.4) Please explain calculation

HP's total Scope 1 and MBM Scope 2 emissions in 2022 was 151,500 tonnes of CO2e and in 2023 it was 146,400 tonnes of CO2e. The year over reduction was 5,100 tonnes of CO2e (5,100 151,500-146,400). This is a 3.4% year over year reduction (0.03375,100/151,500). In 2023 HP implemented several capital / opex funded energy conservation projects and other no/low cost actions to reduce energy consumption. These contributed 89.26 tonnes of CO2e reduction for scope 1 and 1645.43 tonnes of CO2e reduction for scope 2 for a total rounded scope 1 and 2 reduction of 1735 tonnes of CO2e. The project savings are from multiple capital /op ex funded projects and low cost/no cost actions (e.g. LED lighting projects, chiller plant optimization, retro commissioning projects, high efficiency chiller replacements, appliance replacements, Fault Detection & Diagnostics, and temperature setpoint/schedule optimization). Refer to question 7.55.2 for details on projects and no/low-cost actions. The percentage of change from projects and other no/low cost actions was 1.2% (0.0121,735/146,400).

(7.10.1.4) Please explain calculation

HP's total Scope 1 and MBM Scope 2 emissions in 2022 was 151,500 tonnes of CO2e and in 2023 it was 146,400 tonnes of CO2e. The year over reduction was 5,100 tonnes of CO2e (5,100 151,500-146,400). This is a 3.4% year over year reduction (0.03375,100/151,500). The 3.4% 5,100 tonnes of CO2e reduction was a result of the following factors: Renewable energy increase (-6,600 tonnes of CO2e), projects and no/low cost actions (-1,735 tonnes of CO2e), the Poly acquisition (2,563 tonnes of CO2e), and Unidentified emissions (672 tonnes of CO2e). This gives a total of -5,100 tonnes of CO2e. In percentage terms, the increase in renewable energy resulted in a reduction of 4.5%, while projects and no/low cost actions represented a 1.2% reduction. The Poly acquisition contributed to a 1.8% increase, and unidentified emissions accounted for a 0.5% increase. The net effect of these factors was a total reduction of 3.4% tonnes of CO2e. Unidentified emissions of 672 tonnes of CO2e is 0.5% (0.005 672/146,400).

(7.12.1.2) Comment

For Scope 1 and Scope 2 HP has no biogenic emissions present in either category. For Scope 3 emissions, biogenic emissions are present and captured in the manufacturing phase for HP branded paper sold. HP uses the tonnage of HP brand paper sold during the year to calculate associated GHG emissions, HP branded paper is reported to HP by our paper suppliers and paper licensing partners. This data includes certification status and tonnage associated with each certification. A paper emissions factor is applied to determine total emissions associated with HP branded paper sold. This internal paper emissions factor was developed through statistical analysis of the 23 most up-to-date and robust paper LCA studies found. Biogenic emissions are present and embedded in the paper emissions factor that HP utilizes. Therefore, while biogenic emissions are embedded in the calculations, we cannot separate them.
[Fixed row]

(7.15) Does your organization break down its Scope 1 emissions by greenhouse gas type?

Select from:

☑ Yes

(7.15.1) Break down your total gross global Scope 1 emissions by greenhouse gas type and provide the source of each used global warming potential (GWP).

Row 1

(7.15.1.1) Greenhouse gas

Select from:
☑ CO2

(7.15.1.2) Scope 1 emissions (metric tons of CO2e)

46600

(7.15.1.3) GWP Reference

Select from:
☑ IPCC Sixth Assessment Report (AR6 - 100 year)

Row 2

(7.15.1.1) Greenhouse gas

Select from:
☑ CH4

(7.15.1.2) Scope 1 emissions (metric tons of CO2e)

30

(7.15.1.3) GWP Reference

Select from:
☑ IPCC Sixth Assessment Report (AR6 - 100 year)

Row 3

(7.15.1.1) Greenhouse gas

Select from:
☑ N2O

(7.15.1.2) Scope 1 emissions (metric tons of CO2e)

100

(7.15.1.3) GWP Reference

Select from:

☑ IPCC Sixth Assessment Report (AR6 - 100 year)

Row 4

(7.15.1.1) Greenhouse gas

Select from:

☑ HFCs

(7.15.1.2) Scope 1 emissions (metric tons of CO2e)

1100

(7.15.1.3) GWP Reference

Select from:

☑ IPCC Sixth Assessment Report (AR6 - 100 year)

Row 5

(7.15.1.1) Greenhouse gas

Select from:

☑ PFCs

(7.15.1.2) Scope 1 emissions (metric tons of CO2e)

4300

(7.15.1.3) GWP Reference

Select from:

☑ IPCC Sixth Assessment Report (AR6 - 100 year)

(7.30.7.3) MWh fuel consumed for self-generation of electricity

0

(7.30.7.4) MWh fuel consumed for self-generation of heat

0

(7.30.7.8) Comment

Not applicable

Other renewable fuels (e.g. renewable hydrogen)

(7.30.7.1) Heating value

Select from:

☑ Unable to confirm heating value

(7.30.7.2) Total fuel MWh consumed by the organization

0

(7.30.7.3) MWh fuel consumed for self-generation of electricity

0

(7.30.7.4) MWh fuel consumed for self-generation of heat

0

(7.30.7.8) Comment

Not applicable

Coal

(7.30.7.1) Heating value

Select from:

☑ Unable to confirm heating value

(7.30.7.2) Total fuel MWh consumed by the organization

0

(7.30.7.3) MWh fuel consumed for self-generation of electricity

0

(7.30.7.4) MWh fuel consumed for self-generation of heat

0

(7.30.7.8) Comment

Not applicable

Oil

(7.30.7.1) Heating value

Select from:

☑ HHV

(7.30.7.2) Total fuel MWh consumed by the organization

37707

(7.30.7.3) MWh fuel consumed for self-generation of electricity

79

(7.30.7.4) MWh fuel consumed for self-generation of heat

37628

(7.30.7.8) Comment

Includes transportation fleet jet fuel and diesel, and on-site consumption.

Gas

(7.30.7.1) Heating value

Select from:

☑ HHV

(7.30.7.2) Total fuel MWh consumed by the organization

189659

(7.30.7.3) MWh fuel consumed for self-generation of electricity

0

(7.30.7.4) MWh fuel consumed for self-generation of heat

189659

(7.30.7.8) Comment

Includes natural gas and transportation fleet gasoline.

Other non-renewable fuels (e.g. non-renewable hydrogen)

(7.30.7.1) Heating value

Select from:

☑ Unable to confirm heating value

(7.30.7.2) Total fuel MWh consumed by the organization

0

(7.30.7.3) MWh fuel consumed for self-generation of electricity

0

(7.30.7.4) MWh fuel consumed for self-generation of heat

0

(7.30.7.8) Comment

Not applicable

Total fuel

(7.30.7.1) Heating value

Select from:
☑ HHV

(7.30.7.2) Total fuel MWh consumed by the organization

227366

(7.30.7.3) MWh fuel consumed for self-generation of electricity

79

(7.30.7.4) MWh fuel consumed for self-generation of heat

227287

(7.30.7.8) Comment

Includes all fuel consumption
[Fixed row]

(7.30.9) Provide details on the electricity, heat, steam, and cooling your organization has generated and consumed in the reporting year.

Electricity

(7.30.9.1) Total Gross generation (MWh)

2758

(7.30.9.2) Generation that is consumed by the organization (MWh)

(7.30.20) Describe how your organization's renewable electricity sourcing strategy directly or indirectly contributes to bringing new capacity into the grid in the countries/areas in which you operate.

HP is focused on expanding sources of renewable electricity to the grid. Our goal is to replace many of our annual Energy Attribute Certificate (EAC) purchases with power purchase agreements from new generation projects.

(7.30.21) In the reporting year, has your organization faced barriers or challenges to sourcing renewable electricity?

	Challenges to sourcing renewable electricity
	Select from: ☑ Yes, in specific countries/areas in which we operate

[Fixed row]

(7.30.22) Provide details of the country/area-specific challenges to sourcing renewable electricity faced by your organization in the reporting year.

Row 1

(7.30.22.1) Country/area

Select from:

☑ China

(7.30.22.2) Reason why it was challenging to source renewable electricity within selected country/area

Select all that apply

☑ Lack of electricity market structure supporting bilateral PPAs

(7.30.22.3) Provide additional details of the barriers faced within this country/area

We have been informed that China does not allow offsite PPAs or VPPAs.

Row 2

(7.30.22.1) Country/area

Select from:

☑ India

(7.30.22.2) Reason why it was challenging to source renewable electricity within selected country/area

Select all that apply

☑ Issues with landlord-tenant arrangements

(7.30.22.3) Provide additional details of the barriers faced within this country/area

Most of our facilities in India are leased.

Row 3

(7.30.22.1) Country/area

Select from:
☑ Malaysia

(7.30.22.2) Reason why it was challenging to source renewable electricity within selected country/area

Select all that apply
☑ Lack of electricity market structure supporting bilateral PPAs

(7.30.22.3) Provide additional details of the barriers faced within this country/area

Malaysia does not currently allow offsite PPAs.

Row 4

(7.30.22.1) Country/area

Select from:
☑ Singapore

(7.30.22.2) Reason why it was challenging to source renewable electricity within selected country/area

Select all that apply
☑ Limited supply of renewable electricity in the market

(7.30.22.3) Provide additional details of the barriers faced within this country/area

Limited renewable opportunities and very expensive attributes.

Row 5

(7.30.22.1) Country/area

Select from:

☑ Taiwan, China

(7.30.22.2) Reason why it was challenging to source renewable electricity within selected country/area

Select all that apply

☑ Limited supply of renewable electricity in the market

(7.30.22.3) Provide additional details of the barriers faced within this country/area

EACs are limited and very expensive.

Row 6

(7.30.22.1) Country/area

Select from:

☑ Republic of Korea

(7.30.22.2) Reason why it was challenging to source renewable electricity within selected country/area

Select all that apply

☑ Lack of electricity market structure supporting bilateral PPAs

(7.30.22.3) Provide additional details of the barriers faced within this country/area

The Republic of Korea government has recently announced that it will allow corporate PPA's but with additional requirements and restrictions.

☑ unit total revenue

(7.45.4) Metric denominator: Unit total

53718000000

(7.45.5) Scope 2 figure used

Select from:

☑ Market-based

(7.45.6) % change from previous year

14

(7.45.7) Direction of change

Select from:

☑ Increased

(7.45.8) Reasons for change

Select all that apply

☑ Change in renewable energy consumption
☑ Other emissions reduction activities
☑ Change in revenue

(7.45.9) Please explain

The intensity factor increased by 14%. The drivers were a 14.61% decrease in revenue and a rounded 3% year-over-year reduction in scope 1 and 2 GHG emissions due to increased purchases of renewable electricity, and attributes. In 2023, we implemented 15 low-cost operational changes, 29 energy-conservation projects.

(7.45.6) % change from previous year

15.4

(7.45.7) Direction of change

Select from:

☑ Decreased

(7.45.8) Reasons for change

Select all that apply

☑ Change in renewable energy consumption

☑ Other emissions reduction activities

☑ Acquisitions

(7.45.9) Please explain

This decrease was due to a 14.17% increase in full time employees, partially due to the Poly acquisition, and a rounded 3% year-over-year reduction in scope 1 and 2 GHG emissions due to increased purchases of renewable electricity, and attributes. In 2023, we implemented 15 low-cost operational changes, 29 energy-conservation projects.

(7.52.7) Please explain

Since 2016, HP has set a product recycling goal to recycle 1.2 million tonnes of hardware and supplies by 2025 with an emphasis on sustainable product design, lifecycle management, and product takeback and recycling. In 2023 we recycled 112,600 tonnes of computer, printer hardware, and HP printing supplies reaching a cumulative 992,000 tonnes since 2016. Therefore, this is 82.67% progress towards goal (992,000 tonnes since 2016/1.2 million tonnes target 82.67%) and an increase of 9.37% (82.67-73.3% 9.37%) over the previous year percentage progress towards goal.

(7.53.1.79) % of target achieved relative to base year

27.42

(7.53.1.80) Target status in reporting year

Select from:

☑ Underway

(7.53.1.82) Explain target coverage and identify any exclusions

Scope 1 and 2 emissions are calculated for all sites within HP's operational control. Emissions from the Company's owned and leased transportation is reported in Scope 1. GHG emissions not within HP's operational control are accounted for in Scope 3 emissions; these emissions are related to our activities in the reporting year (that is, emissions related to products purchased or sold in the reporting year). Scope 3 includes indirect GHG emissions from sources not owned or directly controlled by HP but related to our activities such as product use, vendor supply chains, delivery services, outsourced activities, and employee travel and commuting (other than travel in the Company's transportation fleet). Scope 3 emissions are a consequence of the activities of HP but occur from sources not owned or controlled by the Company. For more information, see HP Carbon Accounting Manual and HP Water Accounting Manual at https://h20195.www2.hp.com/v2/GetDocument.aspx?docnamec08951351

(7.53.1.83) Target objective

To combat climate change, focused on GHG emissions, circularity, and forests. We use science-based targets to drive progress across our business, consistent with emission levels required to limit global warming to 1.5C.

(7.53.1.84) Plan for achieving target, and progress made to the end of the reporting year

HP set a goal to reduce HP value chain GHG emissions by 50% by 2030 (compared to 2019) and achieve net zero emissions by 2040. In April 2021, we announced our ambitious climate agenda, and set new goals across our value chain to combat climate change, focused on GHG emissions, circularity, and forests. We use science-based targets to drive progress across our business, consistent with emission levels required to limit global warming to 1.5C. HP's five climate action strategic drivers—print and compute as a service, sustainable materials, supply chain decarbonization, energy efficiency, and forest investments—are intended to decouple growth from GHG emissions and resource consumption, drive innovation, and transform our design and business models. In 2018, HP set a goal to decrease total Scope 1 and Scope 2 GHG emissions from global operations (all owned or leased facilities and transportation fleet within our operational control) by 60% by 2025, compared to 2015. This target underwent and passed an official target validation by the Science Based Targets Initiative (SBTi). HP's Scope 3 targets had been previously validated by the SBTi. This target also follows HP's previously set and met SBTi-approved target of a 25% reduction in absolute Scope 1 and 2 emissions by 2025. In 2023, GHG emissions from HP owned or leased facilities and transportation fleet decreased compared to 2015. In 2023, HP's global operations produced 146,400 tonnes of Scope 1 and Scope 2 CO2e emissions, a 2% reduction compared to 2022 and a 62% reduction from our 2015 baseline of 388,700 tonnes of CO2e. Since 2019 and through 2023, the energy consumption of our personal systems products has dropped by 21%, on average. This includes average estimated reductions in energy consumption of 33% in notebooks, 43% in workstations, and 13% in displays. Ongoing design improvements, including more efficient CPUs, panels, and power supplies, have contributed to continued reductions in the typical energy consumption of our notebooks and workstations. HP's carbon footprint of 19,764,400 tonnes of CO2e was 27% less than in 2019. For more information, see pg 32-33 of the HP 2023 Sustainable Impact Report online at https://www8.hp.com/h20195/v2/GetPDF.aspx/c08980815.pdf#page80&zoom100,0,0. and the HP Carbon Accounting Manual at https://h20195.www2.hp.com/v2/GetDocument.aspx?docnamec08951351

Scope 1 and 2 emissions are calculated for all sites within HP's operational control. Emissions from the Company's owned and leased transportation is reported in Scope 1. GHG emissions not within HP's operational control are accounted for in Scope 3 emissions; these emissions are related to our activities in the reporting year (that is, emissions related to products purchased or sold in the reporting year). Scope 3 includes indirect GHG emissions from sources not owned or directly controlled by HP but related to our activities such as product use, vendor supply chains, delivery services, outsourced activities, and employee travel and commuting (other than travel in the Company's transportation fleet). Scope 3 emissions are a consequence of the activities of HP but occur from sources not owned or controlled by the Company. For more information, see HP Carbon Accounting Manual and HP Water Accounting Manual at https://h20195.www2.hp.com/v2/GetDocument.aspx?docnamec08951351

(7.53.1.83) Target objective

To combat climate change, focused on GHG emissions, circularity, and forests. We use science-based targets to drive progress across our business, consistent with emission levels required to limit global warming to 1.5C.

(7.53.1.84) Plan for achieving target, and progress made to the end of the reporting year

In April 2021, we announced our ambitious climate agenda, and set new goals across our value chain to combat climate change, focused on GHG emissions, circularity, and forests. We use science-based targets to drive progress across our business, consistent with emission levels required to limit global warming to 1.5C. HP's five climate action strategic drivers—print and compute as a service, sustainable materials, supply chain decarbonization, energy efficiency, and forest investments—are intended to decouple growth from GHG emissions and resource consumption, drive innovation, and transform our design and business models. Greenhouse gas emissions from HP operations are primarily due to facility energy use. HP has a goal to reduce Scope 1 and Scope 2 GHG emissions from global operations by 65% by 2025, compared to 2015. This target underwent and passed an official target validation by the Science Based Targets Initiative (SBTi). HP's

Scope 3 targets had been previously validated by the SBTi. This target also follows HP's previously set and met SBTi-approved target of a 25% reduction in absolute Scope 1 and 2 emissions by 2025. In 2023, GHG emissions from HP owned or leased facilities and transportation fleet decreased compared to 2015. In 2023, HP's global operations produced 146,400 tonnes of Scope 1 and Scope 2 CO2e emissions, a 2% reduction compared to 2022 and a 62% reduction from our 2015 baseline of 388,700 tonnes of CO2e. Since 2019 and through 2023, the energy consumption of our personal systems products has dropped by 21%, on average. This includes average estimated reductions in energy consumption of 33% in notebooks, 43% in workstations, and 13% in displays. Ongoing design improvements, including more efficient CPUs, panels, and power supplies, have contributed to continued reductions in the typical energy consumption of our notebooks and workstations. HP's carbon footprint of 19,764,400 tonnes of CO2e was 27% less than in 2019. For more information, see pg 32-33 of the HP 2023 Sustainable Impact Report online at https://www8.hp.com/h20195/v2/GetPDF.aspx/c08980815.pdf#page80&zoom100,0,0. and the HP Carbon Accounting Manual at https://h20195.www2.hp.com/v2/GetDocument.aspx?docnamec08951351

(7.53.1.83) Target objective

To combat climate change, focused on GHG emissions, circularity, and forests. We use science-based targets to drive progress across our business, consistent with emission levels required to limit global warming to 1.5C.

(7.53.1.84) Plan for achieving target, and progress made to the end of the reporting year

In April 2021, we announced our ambitious climate agenda, and set new goals across our value chain to combat climate change, focused on GHG emissions, circularity, and forests. We use science-based targets to drive progress across our business, consistent with emission levels required to limit global warming to 1.5C. HP's five climate action strategic drivers—print and compute as a service, sustainable materials, supply chain decarbonization, energy efficiency, and forest investments—are intended to decouple growth from GHG emissions and resource consumption, drive innovation, and transform our design and business models. Greenhouse gas emissions from HP operations are primarily due to facility energy use. Following the acquisition of Samsung Electronics Co., Ltd.'s printer business in 2018, HP set a goal to decrease total Scope 1 and Scope 2 GHG emissions from global operations (all owned or leased facilities and transportation fleet within our operational control) by 60% by 2025, compared to 2015. This target underwent and passed an official target validation by the Science Based Targets Initiative (SBTi). The SBTi notified HP of their approval of this target on July 4, 2019. This target has been revised to a 65% reduction of Scope 1 and 2 emissions by 2025, compared to 2015. HP's Scope 3 targets had been previously validated by the SBTi. This target also follows HP's previously set and met SBTi-approved target of a 25% reduction in absolute Scope 1 and 2 emissions by 2025. In 2023, GHG emissions from HP owned or leased facilities and transportation fleet decreased compared to 2015. In 2023, HP's global operations produced 146,400 tonnes of Scope 1 and Scope 2 CO2e emissions, a 3% reduction compared to 2022 and a 62% reduction from our 2015 baseline of 388,700 tonnes of CO2e. Scope 3 includes indirect GHG emissions from sources not owned or directly controlled by HP but related to our activities such as product use, vendor supply chains, delivery services, outsourced activities, and employee travel and commuting (other than travel in the Company's transportation fleet). Scope 3 emissions are a consequence of the activities of HP but occur from sources not owned or controlled by the Company. For more information, see HP Carbon Accounting Manual and HP Water Accounting Manual at https://h20195.www2.hp.com/v2/GetDocument.aspx?docnamec08951351

(7.53.1.83) Target objective

To combat climate change, focused on GHG emissions, circularity, and forests. We use science-based targets to drive progress across our business, consistent with emission levels required to limit global warming to 1.5C.

(7.53.1.84) Plan for achieving target, and progress made to the end of the reporting year

HP set a goal to reduce HP value chain GHG emissions by 50% by 2030 (compared to 2019). This target underwent and passed an official target validation by the Science Based Targets Initiative (SBTi). In April 2021, we announced our ambitious climate agenda, and set new goals across our value chain to combat climate change, focused on GHG emissions, circularity, and forests. We use science-based targets to drive progress across our business, consistent with emission levels required to limit global warming to 1.5C. HP's five climate action strategic drivers—print and compute as a service, sustainable materials, supply chain decarbonization, energy efficiency, and forest investments—are intended to decouple growth from GHG emissions and resource consumption, drive innovation, and transform our design and business models. Since 2019 and through 2023, the energy consumption of our personal systems products has dropped by 21%, on average. This includes average estimated reductions in energy consumption of 33% in notebooks, 43% in workstations, and 9% in displays. Ongoing design improvements, including more efficient CPUs, panels, and power supplies, have contributed to continued reductions in the typical energy consumption of our notebooks and workstations. HP's carbon footprint of 19,764,400 tonnes of CO2e was 27% less than in 2019, primarily due to reductions related to product use resulting from increased energy efficiency and changes to the mix of products sold. For more information, see pg 32-33 of the HP 2023 Sustainable Impact Report online at https://www8.hp.com/h20195/v2/GetPDF.aspx/c08980815.pdf#page25&zoom100,0,0 and the HP Carbon Accounting Manual at https://h20195.www2.hp.com/v2/GetDocument.aspx?docnamec08951351. This target has now been retired and replaced by a new SBTi validated target.

☑ RE100

(7.54.1.19) Explain target coverage and identify any exclusions

KPI in baseline and target year are shown as a percent of total electricity consumption. This target covers all HP owned or leased facilities worldwide. This target covers all electricity consumption procured and generated.

(7.54.1.20) Target objective

Use 100% renewable electricity in our operations by 2025.

(7.54.1.21) Plan for achieving target, and progress made to the end of the reporting year

In 2016, we set a long-term commitment to use 100% renewable electricity in our global operations, with a goal of 40% by 2020. After achieving our interim target, we recalculated energy use and Scope 1 and Scope 2 GHG emissions data, per guidance in the GHG Protocol, and we increased our ambition and set goals to achieve 60% by 2025 and 100% by 2035. In FY20, we began to consider further accelerating this goal and in FY21 updated the goal to 100% RE by 2025. HP's global operations procured and generated 293,289 MWh of renewable electricity and attributes, equivalent to 59% of our global electricity consumption.

☑ EV100

(7.54.2.18) Please explain target coverage and identify any exclusions

HP is one of 10 founding members of EV100, a Climate Group initiative aimed at accelerating technological development of electric vehicles (Evs) worldwide. In support of this effort, we have committed to installing EV infrastructure at all feasible sites worldwide by 2030. We have selected 78 target locations to install EV infrastructure as these are the locations where we have over 200 personnel headcount.

(7.54.2.19) Target objective

To combat climate change, focused on GHG emissions, circularity, and forests. We use science-based targets to drive progress across our business, consistent with emission levels required to limit global warming to 1.5C.

(7.54.2.20) Plan for achieving target, and progress made to the end of the reporting year

We have committed to installing EV infrastructure at all feasible sites worldwide by 2030. In 2023, we offered EV infrastructure at 54% of 78 target sites, including many new charging stations installed during the year, including a standalone, solar powered EV-charging site at our R&D facility in Costa Rica. Wherever feasible, we require new building constructions and leases to include EV infrastructure. We started our first EV fleet pilots in the Netherlands in October 2020 and have since introduced EV choices in seven countries. By the end of 2023, 14% of our fleet was EV and 29% was hybrid vehicles, including full hybrid and plug-in hybrid vehicles.

Row 3

(7.54.2.12) % of target achieved relative to base year

94.0000000000

(7.54.2.13) Target status in reporting year

Select from:

☑ Underway

(7.54.2.15) Is this target part of an emissions target?

Yes, HP has the goal of helping suppliers reduce their carbon footprint by cutting two million tonnes of CO2e between 2010 and 2025. Starting base year HP committed to reduce two million tonnes of CO2e, in reporting year HP still has 120,000 tonnes of CO2e to go to achieve the target.

(7.54.2.16) Is this target part of an overarching initiative?

Select all that apply

☑ No, it’s not part of an overarching initiative

(7.54.2.18) Please explain target coverage and identify any exclusions

This target covers all suppliers in HP’s supply chain. For addressing this goal, we prioritize engagement with suppliers that may benefit most from capability building to improve facility-level energy performance.

(7.54.2.19) Target objective

To combat climate change, focused on GHG emissions, circularity, and forests. We use science-based targets to drive progress across our business, consistent with emission levels required to limit global warming to 1.5C.

(7.54.2.20) Plan for achieving target, and progress made to the end of the reporting year

To achieve this target, since 2010 we have worked to help suppliers to build capabilities, identify ways to improve energy efficiency including through implementation of energy management systems, and explore the use of renewable energy. We continue to advance toward our goal of helping suppliers reduce their carbon footprint by cutting two million tonnes of CO2 emissions between 2010 and 2025. Since 2010, we estimate that participants in this and other programs have avoided 1.88 million tonnes of CO2e emissions19 and saved a cumulative 1.0 billion kWh (US128 million) of electricity, including 184,000 tonnes of CO2e emissions and 36 million kWh (US4.7 million) in 2023. For more information, see p. 26 of the HP 2023 Sustainable Impact Report online at https://www8.hp.com/h20195/v2/GetPDF.aspx/c08980815.pdf

(7.54.2.13) Target status in reporting year

Select from:

☑ Achieved and maintained

(7.54.2.15) Is this target part of an emissions target?

No, this target is not directly part of an emissions target. However, this engagement with suppliers supports calculation of progress versus our Scope 3: Purchased Goods & Services target and also is fundamental to the engagement necessary to drive supplier environmental performance improvement.

(7.54.2.16) Is this target part of an overarching initiative?

Select all that apply

☑ No, it's not part of an overarching initiative

(7.54.2.18) Please explain target coverage and identify any exclusions

HP's annual goal is to engage production suppliers and collect GHG data from suppliers representing 95% of production spend. We have achieved this and reported on the collected data for more than a decade. HP values transparency. Because HP's supply chain now accounts for more than half (63% in 2023) of HP's carbon footprint, we measure and report our suppliers' GHG emissions by directly collecting data from our suppliers annually, using industry and cross-industry standard reporting platforms such as the RBA Online Environmental Survey (HP was an original contributing developer of the tool and continues to aid its development and implementation) and the CDP Supply Chain program (as a member of which HP gives input towards continuous improvement). HP's hundreds of production (direct) suppliers and thousands of nonproduction (indirect) suppliers are essential partners in our efforts to embed sustainability across every aspect of our business and reduce GHG emissions across the value chain. Given such large numbers of suppliers, we prioritize our data collection by focusing on our higher-spend suppliers. This is because higher-spend suppliers have proportionately more significant impacts on HP's calculated Scope 3 supplier emissions (which is compiled by allocating supplier emissions in proportion to the ratio of HP's spend with each supplier to each supplier's revenue). For example, nearly 3% of HP's suppliers by number constitute almost 93% of our total direct and indirect procurement spend. Knowing these suppliers' relative impacts, allows HP to better understand which suppliers *present the greatest opportunity to reduce HP’s Scope 3 emissions. We also collect data from lower spend strategic suppliers. Our deeper overall engagement with high-spend and strategic suppliers gives us greater ability to influence performance improvements. Additionally, to ensure a robust data set for HP’s supply chain carbon emissions we leverage our CDP Supply Chain program membership to collect data from suppliers deeper in our spend. HP incentivizes our suppliers to provide adequate responses through our Sustainability Scorecard process.*

(7.54.2.19) Target objective

Achievement of this target is enabled by the consistency of our annual environmental data request raising supplier awareness and reporting maturity.

(7.54.2.21) List the actions which contributed most to achieving this target

• We also conduct ongoing capability building to ensure suppliers can provide well-formed responses. • We foster industry and cross-industry standard reporting platforms such as the RBA Online Environmental Survey (HP was an original contributing developer of the tool and continues to aid its development and implementation) and the CDP Supply Chain program (as a member of which HP gives input towards continuous improvement). • We continuously monitor which suppliers have submitted and prioritize follow up with suppliers that are most meaningful to both this targets as well as to our broader efforts at SC GHG reduction. Additionally, our Sustainable Impact Scorecard program incentivizes suppliers to provide annual environmental data.

10/31/2040

(7.54.3.6) Is this a science-based target?

Select from:

☑ Yes, we consider this a science-based target, and we have committed to seek validation of this target by the Science Based Targets initiative in the next two years

(7.54.3.8) Scopes

Select all that apply

☑ Scope 1

☑ Scope 2

☑ Scope 3

(7.54.3.9) Greenhouse gases covered by target

Select all that apply

☑ Carbon dioxide (CO2)

☑ Methane (CH4)

☑ Nitrous oxide (N2O)

☑ Hydrofluorocarbons (HFCs)

☑ Perfluorocarbons (PFCs)

(7.54.3.10) Explain target coverage and identify any exclusions

HP has set a goal to achieve net zero greenhouse gas (GHG) emissions across for Scope 1, 2 and 3 emissions by 2040. We have also committed to an interim goal to reduce absolute value chain GHG by 50% for Scope 1, 2 and 3 by 2030 compared to 2019.

(7.54.3.11) Target objective

Our missions is taking urgent and decisive action to achieve net zero carbon emissions across our entire value chain, give back more to forests than we take, and innovate our products and services for a more circular economy.

(7.54.3.12) Do you intend to neutralize any residual emissions with permanent carbon removals at the end of the target?

Select from:

☑ Yes

(7.54.3.13) Do you plan to mitigate emissions beyond your value chain?

Select from:

☑ No, we do not plan to mitigate emissions beyond our value chain

(7.54.3.14) Do you intend to purchase and cancel carbon credits for neutralization and/or beyond value chain mitigation?

Select all that apply

☑ No, we do not plan to purchase and cancel carbon credits for neutralization and/or beyond value chain mitigation

(7.54.3.15) Planned milestones and/or near-term investments for neutralization at the end of the target

We have committed to an interim goal to reduce absolute value chain GHG by 50% for Scope 1, 2 and 3 by 2030 compared to 2019.

(7.54.3.17) Target status in reporting year

Select from:

☑ Underway

(7.54.3.19) Process for reviewing target

HP continually measures our value chain GHG footprint and publicly reports in it our Sustainable Impact Report and CDP response. Likewise, we publish our progress versus the base year of all our GHG targets. We engage with stakeholders – such as through our membership in the WWF Climate Business Network – and

review best-practice frameworks – such as CDP's and SBTi's – to understand prevailing expectations for climate ambition and review our climate targets accordingly – including HP's net zero goal.
[Add row]

(7.55) Did you have emissions reduction initiatives that were active within the reporting year? Note that this can include those in the planning and/or implementation phases.

Select from:
☑ Yes

(7.55.1) Identify the total number of initiatives at each stage of development, and for those in the implementation stages, the estimated CO2e savings.

	Number of initiatives	**Total estimated annual CO2e savings in metric tonnes CO2e (only for rows marked *)**
Under investigation	*1*	*`Numeric input*
To be implemented	*14*	*263.86*
Implementation commenced	*16*	*972.81*
Implemented	*45*	*101666.7*
Not to be implemented	*17*	*`Numeric input*

[Fixed row]

(7.55.2) Provide details on the initiatives implemented in the reporting year in the table below.

Row 1

(7.55.2.1) Initiative category & Initiative type

Energy efficiency in buildings

☑ Other, please specify :Includes scope 2 (market-based) savings from multiple capital /OpEx funded projects and low cost/no cost actions (e.g. LED lighting projects, chiller plant optimization, retro commissioning high efficiency chiller replacements, appliance replacement)

(7.55.2.2) Estimated annual CO2e savings (metric tonnes CO2e)

1645.43

(7.55.2.3) Scope(s) or Scope 3 category(ies) where emissions savings occur

Select all that apply

☑ Scope 2 (market-based)

(7.55.2.4) Voluntary/Mandatory

Select from:

☑ Voluntary

(7.55.2.5) Annual monetary savings (unit currency – as specified in C0.4)

1204538

(7.55.2.6) Investment required (unit currency – as specified in C0.4)

3269862

(7.55.2.7) Payback period

Select from:

☑ 1-3 years

(7.55.2.8) Estimated lifetime of the initiative

Select from:

☑ 6-10 years

(7.55.2.9) Comment

Examples of these projects include: • Boise, Idaho, United States: We replaced two 25-year-old chillers with two new, high-efficiency chillers. This upgrade is expected to save 1,269 MWh of energy annually—8% of the site's consumption. • Sandston, Virginia, United States: We undertook an LED lighting upgrade at one of the two sites at this location, which increased the site's lighting intensity while saving 33% of its total annual electricity consumption. The project will pay for itself in 2.4 years, and is projected to save 555 MWh annually. • Singapore: By switching the site air compressor cooling water source from 7C chilled water to 29C cooling tower water at one of our manufacturing sites, this project will save an estimated 1,068 MWh annually, equivalent to 2% of the site's consumption.

Row 2

(7.55.2.1) Initiative category & Initiative type

Energy efficiency in buildings

☑ Other, please specify :Includes the scope 1 savings from capital funded projects and low cost/no cost actions (e.g., Boiler Controls Upgrade Project, and Fault Detection & Diagnostics.)

(7.55.2.2) Estimated annual CO2e savings (metric tonnes CO2e)

☑ <1 year

(7.55.2.9) Comment

This category includes the annual Energy Attribute Certificate (EAC) purchase and the annual purchased renewable electricity (includes deregulated green contracts and on-site PPA's).
[Add row]

(7.55.3) What methods do you use to drive investment in emissions reduction activities?

Row 1

(7.55.3.1) Method

Select from:

☑ Employee engagement

(7.55.3.2) Comment

Our employees worldwide make a vital contribution to improving our environmental performance, and employee engagement initiatives enable HP's global workforce to directly support our Sustainable Impact goals and vision. For example, during Earth Week in April 2023, we held a campaign called "Go beyond for people and the planet" that emphasizes the connection between people and the planet, and captures our belief that it's not enough to do less harm—we must work together to do more good. Throughout the week, employees had the opportunity to: Learn: Visiting an interactive webpage to help uncover tangible ways to make a difference. Take Action: Find events and volunteer opportunities happening at the HP site, in employees communities, and online. Celebrate: Get to know employees from across the globe who were creating a positive impact—and empowering colleagues and customers to do the same.

Row 2

(7.55.3.1) Method

Select from:

☑ Dedicated budget for other emissions reduction activities

(7.55.3.2) Comment

In 2023, an 860K expense budget was dedicated to the purchase of RECS/IRECS/GOs to offset the Scope 2 emissions from HP sites located in the USA, Canada, Mexico, China, India, Israel and Europe. Completed in January 2023, our on-site solar PPA in Barcelona, Spain, provides 9% of the annual electricity consumed at that location.

Row 3

(7.55.3.1) Method

Select from:

☑ Compliance with regulatory requirements/standards

(7.55.3.2) Comment

In 2021 HP completed certification of two of its sites in Singapore for ISO 50001 and the certification is valid for 3 years. Each year HP carries out a surveillance audit to ensure the system is in still operating in compliance with the ISO 50001 standard.

Row 4

(7.55.3.1) Method

Select from:

☑ Dedicated budget for energy efficiency

(7.55.3.2) Comment

We implemented multiple capital /op ex funded projects and low cost/no cost actions (e.g. LED lighting projects, chiller plant optimization, retro commissioning projects, high efficiency chiller replacements, appliance replacements, Boiler Controls Upgrade Project Fault Detection & Diagnostics, and temperature setpoint/schedule optimization).HP provided a dedicated 3.2 million capital budget to fund these energy efficiency projects. Note that many of these energy conservation projects were implemented at sites that achieved 100% renewable electricity. These projects provided electricity savings, however there were no Scope 2 carbon reductions because the site already had no Scope 2 market-based methodology emissions. The annual monetary savings and investment required shown in 7.55.2 only includes the projects that were “implemented” in the reporting year. The remaining capital funds were used for projects where “implementation has commenced” in the reporting year but will be completed in 2024. That is why the 3.2 million budget does not match the investment shown in 7.55.2.

Row 5

(7.55.3.1) Method

Select from:

☑ Other :Optimization of real estate portfolio.

(7.55.3.2) Comment

As of October 31, 2023, 13 sites globally had achieved Leadership in Energy and Environmental Design (LEED) certifications for buildings, including 11 at the Gold level or above, 3 sites had achieved BREEAM (Building Research Establishment Environmental Assessment Method) certifications for building, including 2 at the Excellent level, 1 location had achieved SITES certification for sustainable landscape, and 1 site had achieved TRUE certification for waste diversion. All new build-outs seek to meet the standard of LEED v4 Gold and/or a local equivalent (such as BREEAM).

(7.73.2.3) Description of good/ service

11.6" Notebook

(7.73.2.4) Type of product

Select from:
☑ Final

(7.73.2.6) Total emissions in kg CO2e per unit

149

(7.73.2.10) Methods used to estimate lifecycle emissions

Select from:
☑ Other, please specify :Global Warming Potential (GWP 100, excluding biogenic carbon) from the IPCC AR5 (IPCC, 2013), in conformance with ISO14040/14044

Row 8

(7.73.2.2) Name of good/ service

HP OMEN 34c WQHD 165Hz

(7.73.2.3) Description of good/ service

Curved Gaming Monitor

(7.73.2.4) Type of product

Select from:

☑ Final

(7.73.2.6) Total emissions in kg CO2e per unit

490

(7.73.2.10) Methods used to estimate lifecycle emissions

Select from:

☑ Other, please specify :Global Warming Potential (GWP 100, excluding biogenic carbon) from the IPCC AR5 (IPCC, 2013), in conformance with ISO14040/14044

Row 9

(7.73.2.2) Name of good/ service

HP Zbook Fury 16 G10

(7.73.2.3) Description of good/ service

Mobile Workstation

(7.73.2.4) Type of product

Select from:

☑ Final

(7.73.2.6) Total emissions in kg CO2e per unit

401

(7.73.2.10) Methods used to estimate lifecycle emissions

Select from:

☑ Other, please specify :Global Warming Potential (GWP 100, excluding biogenic carbon) from the IPCC AR5 (IPCC, 2013), in conformance with ISO14040/14044

Row 10

(7.73.2.2) Name of good/ service

HP EliteDesk 800 G9 SFF

(7.73.2.3) Description of good/ service

Small Form Factor Desktop

(7.73.2.4) Type of product

Select from:

☑ Final

(7.73.2.6) Total emissions in kg CO2e per unit

279

(7.73.2.10) Methods used to estimate lifecycle emissions

Select from:

☑ Other, please specify :Global Warming Potential (GWP 100, excluding biogenic carbon) from the IPCC AR5 (IPCC, 2013), in conformance with ISO14040/14044
[Add row]

(7.73.3) Complete the following table with data for lifecycle stages of your goods and/or services.

Row 1

(7.73.3.2) Name of good/ service

HP Officejet Pro 8730

(7.73.3.3) Scope

Select from:

☑ Scope 3

(7.73.3.4) Lifecycle stage

Select from:

☑ Cradle to gate

(7.73.3.5) Emissions at the lifecycle stage in kg CO2e per unit

140.7

(7.73.3.6) Lifecycle stage under your ownership or control

Select from:

☑ No

(7.73.3.7) Type of data used

Select from:

☑ Primary and secondary

(7.73.3.9) If applicable, describe the verification/assurance of the product emissions data

HP's Scope 3 GHG emissions are assured using WRI/WBCSD's The Greenhouse Gas Protocol Corporate Value Chain (Scope 3) Accounting and Reporting Standard and HP's Carbon Accounting Manual by EY LLC in accordance with attestation standards established by the American Institute of Certified Public Accountants (AICPA) in AT-C section 105, Concepts Common to All Attestation Engagements and AT-C section 210, Review Engagements.

Row 2

(7.73.3.2) Name of good/ service

HP Officejet Pro 8730

(7.73.3.3) Scope

Select from:

☑ Scope 3

(7.73.3.4) Lifecycle stage

Select from:

☑ Packaging

(7.73.3.5) Emissions at the lifecycle stage in kg CO2e per unit

6.3

(7.73.3.6) Lifecycle stage under your ownership or control

Select from:

☑ No

(7.73.3.7) Type of data used

Select from:

☑ Primary and secondary

(7.73.3.9) If applicable, describe the verification/assurance of the product emissions data

HP's Scope 3 GHG emissions are assured using WRI/WBCSD’s The Greenhouse Gas Protocol Corporate Value Chain (Scope 3) Accounting and Reporting Standard and HP’s Carbon Accounting Manual by EY LLC in accordance with attestation standards established by the American Institute of Certified Public Accountants (AICPA) in AT-C section 105, Concepts Common to All Attestation Engagements and AT-C section 210, Review Engagements.

Row 3

(7.73.3.2) Name of good/ service

HP Officejet Pro 8730

(7.73.3.3) Scope

Select from:
☑ Scope 3

(7.73.3.4) Lifecycle stage

Select from:
☑ Distribution

(7.73.3.5) Emissions at the lifecycle stage in kg CO2e per unit

6.9

(7.73.3.6) Lifecycle stage under your ownership or control

Select from:
☑ No

(7.73.3.7) Type of data used

Select from:
☑ Primary and secondary

(7.73.3.9) If applicable, describe the verification/assurance of the product emissions data

HP's Scope 3 GHG emissions are assured using WRI/WBCSD’s The Greenhouse Gas Protocol Corporate Value Chain (Scope 3) Accounting and Reporting Standard and HP’s Carbon Accounting Manual by EY LLC in accordance with attestation standards established by the American Institute of Certified Public Accountants (AICPA) in AT-C section 105, Concepts Common to All Attestation Engagements and AT-C section 210, Review Engagements.

Row 4

(7.73.3.2) Name of good/ service

HP Officejet Pro 8730

(7.73.3.3) Scope

Select from:

☑ Scope 3

(7.73.3.4) Lifecycle stage

Select from:

☑ Consumer Use

(7.73.3.5) Emissions at the lifecycle stage in kg CO2e per unit

63

(7.73.3.6) Lifecycle stage under your ownership or control

Select from:

☑ No

(7.73.3.7) Type of data used

Select from:

☑ Primary and secondary

(7.73.3.9) If applicable, describe the verification/assurance of the product emissions data

[Add row]

(7.73.4) Please detail emissions reduction initiatives completed or planned for this product.

Row 1

(7.73.4.2) Initiative ID

Select from:

☑ Initiative 1

(7.73.4.3) Description of initiative

GHG emissions associated with product energy use equaled 6,656,000 tonnes of CO2e in 2023—34% of our overall carbon footprint. This equaled a decrease of 39% in absolute GHG emissions compared to 2019. A significant amount of the improvement was due to ongoing design improvements, including more efficient CPUs, panels, and power supplies, have contributed to continued reductions in the typical energy consumption of our notebooks and workstations. HP product use GHG emissions intensity measures per unit GHG emissions during anticipated product lifetime use. These emissions represent more than 99% of HP product units shipped each year, including notebooks, tablets, desktops, mobile computing devices, workstations, displays, and digital signage. These values are then weighted by contribution of personal systems and printing products to overall revenue in the current year.

(7.73.4.4) Completed or planned

Select from:

☑ Completed

[Add row]

(7.73.5) Have any of the initiatives described in 7.73.4 been driven by requesting CDP Supply Chain members?

Select from:

☑ No

(7.74) Do you classify any of your existing goods and/or services as low-carbon products?

Select from:

☑ Yes

(7.74.1) Provide details of your products and/or services that you classify as low-carbon products.

Row 1

(7.74.1.1) Level of aggregation

Select from:

☑ Group of products or services

(7.74.1.2) Taxonomy used to classify product(s) or service(s) as low-carbon

Select from:

☑ Other, please specify :third-party lifecycle assessment

(7.74.1.3) Type of product(s) or service(s)

Other

☑ Other, please specify :Closed loop recycled plastic

(7.74.1.4) Description of product(s) or service(s)

Closed loop recycled plastic in HP Original print cartridges: Our closed loop recycling process combines plastic from HP ink cartridges recovered via our Planet Partners program with plastics from recycled bottles and apparel hangers, to create a reconstituted plastic that meets HP's specifications for use in manufacturing new HP print cartridges. More than 88% of our Original HP Ink Cartridges contain 5%–75% postconsumer recycled content, and 100% of Original HP Toner Cartridges contain 1%–79% postconsumer or postindustrial recycled content. Since 2006, we have manufactured over 5.8 billion Original HP and Samsung cartridges using a cumulative 148,000 tonnes of recycled plastic, including from recycled HP cartridges. This has kept more than one billion Original HP cartridges and six billion postconsumer plastic bottles out of landfills by upcycling these materials for continued use.

(7.74.1.5) Have you estimated the avoided emissions of this low-carbon product(s) or service(s)

Select from:

☑ Yes

(7.74.1.6) Methodology used to calculate avoided emissions

Select from:

☑ Other, please specify

(7.74.1.7) Life cycle stage(s) covered for the low-carbon product(s) or services(s)

Select from:

☑ Cradle-to-gate

(7.74.1.8) Functional unit used

Kg rPP/rPET in product (ink cartridges)

(7.74.1.9) Reference product/service or baseline scenario used

Kg virgin PP&PET in product (ink cartridges)

(7.74.1.10) Life cycle stage(s) covered for the reference product/service or baseline scenario

Select from:

☑ Cradle-to-gate

(7.74.1.11) Estimated avoided emissions (metric tons CO2e per functional unit) compared to reference product/service or baseline scenario

1.4

(7.74.1.12) Explain your calculation of avoided emissions, including any assumptions

According to a 2021 life cycle assessment, the recycled plastic in Original HP Ink Cartridges has an average 46% smaller carbon footprint than the virgin plastic in HP Ink Cartridges—even when accounting for the environmental impact associated with collecting, transporting, and processing used cartridges and plastic bottles or hangers. To calculate, we used an attributional estimation approach –measuring the difference in total life-cycle GHG emissions between ink cartridges using virgin PP and PET and recycled PP and recycled PET.

(7.74.1.13) Revenue generated from low-carbon product(s) or service(s) as % of total revenue in the reporting year

7.6

[Add row]

(7.79) Has your organization canceled any project-based carbon credits within the reporting year?

Select from:

☑ No

C9. Environmental performance - Water security

(9.1) Are there any exclusions from your disclosure of water-related data?

Select from:

☑ Yes

(9.1.1) Provide details on these exclusions.

Row 1

(9.1.1.1) Exclusion

Select from:

☑ Other, please specify **:**Rainwater (which eventually becomes groundwater) at our site in Corvallis, OR (COR)

(9.1.1.2) Description of exclusion

De-watering wells are present at HP's Corvallis, OR site to manage water tables for structural purposes by withdrawing naturally occurring groundwater and repurposing for irrigation or to return to local surface bodies of water through storm drains. Groundwater withdrawn through de-watering wells at the site is excluded from the water withdrawal amount reported due to the lack of data available to measure or estimate. Water from this source does not represent a significant portion of the total water used or consumed.

(9.1.1.3) Reason for exclusion

Select from:

☑ Data is not available

(9.1.1.4) Primary reason why data is not available

Select from:

☑ Data collection is in progress

(9.1.1.7) Percentage of water volume the exclusion represents

Select from:

☑ 1-5%

(9.1.1.8) Please explain

De-watering wells are present at HP's Corvallis, OR site to manage water tables for structural purposes by withdrawing naturally occurring groundwater and repurposing for irrigation or to return to local surface bodies of water through storm drains. Groundwater withdrawn through de-watering wells at the site is excluded from the water withdrawal amount reported due to the lack of data available to measure or estimate. Water from this source does not represent a significant portion of the total water used or consumed.

[Add row]

(9.2) Across all your operations, what proportion of the following water aspects are regularly measured and monitored?

Water withdrawals – total volumes

(9.2.1) % of sites/facilities/operations

Select from:

☑ 76-99

(9.2.2) Frequency of measurement

Select from:

☑ Monthly

(9.2.3) Method of measurement

98.6% of HP's water withdrawal volumes are measured and monitored using metering devices, utility invoices, or estimated data using an HP calculated intensity factor on a monthly basis.

(9.2.4) Please explain

Frequency and method of measurement: 98.6% of HP's water withdrawal volumes are measured and monitored using metering devices, utility invoices, or estimated data using an HP calculated intensity factor on a monthly basis. Water withdrawal is collected via invoiced data where available. The majority of water by volume is tracked via invoice. For sources such as rainwater or well water, site FMs track collection/withdrawal. All volumes are stored in Schneider's Resource Advisor database and have multiple QC performed upon receipt including monthly (regional data reviews), quarterly (quarterly scorecard data reviews) and then annually (annual data assurance review) reviews. Also, when an invoice or data point is receipted, Schneider conducts completion checks and variance testing to ensure data accuracy.

Water withdrawals – volumes by source

(9.2.1) % of sites/facilities/operations

Select from:

☑ 76-99

(9.2.2) Frequency of measurement

Select from:

☑ Monthly

(9.2.3) Method of measurement

98.6% of HP's water withdrawal volumes are measured and monitored using metering devices, utility invoices or estimated data using an HP calculated intensity factor on a monthly basis, including tracking the source of all withdrawals.

(9.2.4) Please explain

Frequency and method of measurement: 98.6% of HP's water withdrawal volumes are measured and monitored using metering devices, utility invoices or estimated data using an HP calculated intensity factor on a monthly basis, including tracking the source of all withdrawals. Water withdrawal is collected via invoiced data where available. The majority of water by volume is tracked via invoice. For sources such as rainwater or well water, site FMs track collection/withdrawal. All volumes are stored in Schneider's Resource Advisor database and have multiple QC performed upon receipt including monthly (regional data reviews), quarterly (quarterly scorecard data reviews) and then annually (annual data assurance review) reviews. Also, when an invoice or data point is receipted, Schneider conducts completion checks and variance testing to ensure data accuracy.

Water withdrawals quality

(9.2.1) % of sites/facilities/operations

Select from:

☑ Not relevant

(9.2.4) Please explain

The majority of HP's water withdrawals come from municipal water utility suppliers. These suppliers are responsible for water quality monitoring to ensure they provide customers with the level of water quality that complies with local requirements. We measure water withdrawal quality if there is an identified need to measure by our EHS team. HP conducts business in a manner that delivers leading environmental, health, and safety performance consistent with commitment to HP EHS Standards for Air and Water, and that we meet or exceed all applicable legal requirements, local codes, and regulations

Water discharges – total volumes

(9.2.1) % of sites/facilities/operations

Select from:

☑ 51-75

(9.2.2) Frequency of measurement

Select from:

☑ Monthly

(9.2.3) Method of measurement

61.1% of HP's water discharge numbers are measured using metering devices, utility invoices or estimated data using an HP calculated intensity factor on a monthly basis. Water discharges are collected via invoiced data where available.

(9.2.4) Please explain

Frequency and method of measurement: 61.1% of HP's water discharge numbers are measured using metering devices, utility invoices or estimated data using an HP calculated intensity factor on a monthly basis. Water discharges are collected via invoiced data where available. All volumes are stored in Schneider's Resource Advisor database and have multiple QC performed upon receipt as well as quarterly (quarterly scorecard data reviews) then annually (annual data assurance review) including monthly (regional data reviews), quarterly (quarterly scorecard data reviews) and then annually (annual data assurance review) reviews. Also, when an invoice or data point is receipted, Schneider conducts completion checks and variance testing to ensure data accuracy.

Water discharges – volumes by destination

(9.2.1) % of sites/facilities/operations

Select from:

☑ 51-75

(9.2.2) Frequency of measurement

Select from:

☑ Monthly

(9.2.3) Method of measurement

61.1% of HP's water discharges are monitored by destination using utility invoices, metered data or an HP calculated intensity factor on a monthly basis. Water discharges are collected via invoiced data where available

(9.2.4) Please explain

Frequency and method of measurement: 61.1% of HP's water discharges are monitored by destination using utility invoices, metered data or an HP calculated intensity factor on a monthly basis. Water discharges are collected via invoiced data where available. All volumes are stored in Schneider's Resource Advisor database and have multiple QC performed upon receipt including monthly (regional data reviews), quarterly (quarterly scorecard data reviews) and then annually (annual data assurance review) reviews. Also, when an invoice or data point is receipted, Schneider conducts completion checks and variance testing to ensure data accuracy.

Water discharges – volumes by treatment method

(9.2.1) % of sites/facilities/operations

Select from:

☑ 51-75

(9.2.2) Frequency of measurement

Select from:

☑ Monthly

(9.2.3) Method of measurement

61.1% of HP's water discharge volume by treatment method are monitored using invoice data, metered devices or estimated data using an HP calculated intensity factor on a monthly basis. Water discharges are collected via invoiced data where available

(9.2.4) Please explain

Frequency and method of measurement: 61.1% of HP's water discharge volume by treatment method are monitored using invoice data, metered devices or estimated data using an HP calculated intensity factor on a monthly basis. Water discharges are collected via invoiced data where available. Volumes discharged to third parties are stored in Schneider's Resource Advisor database and have multiple QC performed upon receipt including monthly (regional data reviews), quarterly (quarterly scorecard data reviews) and then annually (annual data assurance review) reviews. Also, when an invoice or data point is receipted, Schneider conducts completion checks and variance testing to ensure data accuracy. Industrial wastewater treatment processes are monitored on site in accordance with local permit requirements.

Water discharge quality – by standard effluent parameters

(9.2.1) % of sites/facilities/operations

Select from:

☑ 100%

(9.2.2) Frequency of measurement

Select from:

☑ Monthly

(9.2.3) Method of measurement

At all sites where it is required, 100% of HP's discharge quality by standard effluent parameters is measured using monitoring devices and is closely monitored under the requirements of their regulatory permits on a monthly basis.

(9.2.4) Please explain

Frequency and method of measurement: Where required by local permitting criteria, 100% of HP's discharge quality by standard effluent parameters is measured using monitoring devices and is closely monitored under the requirements of the regulatory permits on a monthly basis.

Water discharge quality – emissions to water (nitrates, phosphates, pesticides, and/or other priority substances)

(9.2.1) % of sites/facilities/operations

Select from:

☑ 100%

(9.2.2) Frequency of measurement

Select from:

☑ Monthly

(9.2.3) Method of measurement

Laboratory analysis

(9.2.4) Please explain

HP monitors quality of discharge emissions to water at 100% of sites where local permits require monitoring. HP discharges to the storm water sewer system at our facilities in Malaysia (PEN) and Singapore (DRD), before that water is discharged to groundwater/reservoir. Prior to discharge, internal water treatment plants monitor and treat substances as required by local regulations. At PEN, we monitor monthly for 31 parameters under Standard B of Malaysia Environmental Quality (Industrial Effluent) Regulations 2009. This includes: Lead, Nickel, Cadmium, Mercury. At DRD, we adhere to Singapore's Sewerage and Drainage (Trade Effluent) Regulations and conduct monthly monitoring for all required substances prior to discharge. At our facility in Corvallis (COR), primary treatment of industrial wastewater occurs to remove heavy metals and solid particles. After primary treatment and pH neutralization, industrial wastewater is sent to the City of Corvallis for secondary and tertiary treatment.

Water discharge quality – temperature

(9.2.1) % of sites/facilities/operations

Select from:

☑ 100%

(9.2.2) Frequency of measurement

Select from:

☑ Monthly

(9.2.3) Method of measurement

At all sites where it is required, HP's discharge quality by temperature is measured using monitoring devices and is closely monitored under the requirements of regulatory permits on a monthly basis.

(9.2.4) Please explain

Frequency and method of measurement: Where required by local permitting criteria, HP's discharge quality by temperature is measured using monitoring devices and is closely monitored under the requirements of regulatory permits on a monthly basis.

Water consumption – total volume

(9.2.1) % of sites/facilities/operations

Select from:

☑ 76-99

(9.2.2) Frequency of measurement

Select from:

☑ Monthly

(9.2.3) Method of measurement

98.6% of HP's total water consumption volumes are measured and monitored using metering devices, utility invoices or estimated data using an HP calculated intensity factor on a monthly basis.

(9.2.4) Please explain

Frequency and method of measurement: 98.6% of HP's total water consumption volumes are measured and monitored using metering devices, utility invoices or estimated data using an HP calculated intensity factor on a monthly basis. All volumes are stored in Schneider's Resource Advisor database and have multiple QC performed upon receipt including monthly (regional data reviews), quarterly (quarterly scorecard data reviews) and then annually (annual data assurance review) reviews. Also, when an invoice or data point is receipted, Schneider conducts completion checks and variance testing to ensure data accuracy.

Water recycled/reused

(9.2.1) % of sites/facilities/operations

Select from:

☑ 100%

(9.2.2) Frequency of measurement

Select from:

☑ Monthly

(9.2.3) Method of measurement

100% of HP's total recycled/reused water is monitored using metering devices, utility invoices or estimated data using an HP calculated intensity factor on a monthly basis.

(9.2.4) Please explain

Frequency and method of measurement: 100% of HP's total recycled/reuse water is monitored using metering devices, utility invoices or estimated data using an HP calculated intensity factor on a monthly basis. All recycled/reused volumes are stored in Schneider's Resource Advisor database and have multiple QC performed upon receipt as well as quarterly (quarterly scorecard data reviews) then annually (annual data assurance review). When an invoice or data point is receipted, Schneider conducts completion checks and variance testing to ensure data accuracy

The provision of fully-functioning, safely managed WASH services to all workers

(9.2.1) % of sites/facilities/operations

Select from:

☑ 100%

(9.2.2) Frequency of measurement

Select from:

☑ Daily

(9.2.3) Method of measurement

WASH expectations are outlined in HP's global EHS Policy and audited as part of our EHS standards and governance processes.

(9.2.4) Please explain

Frequency and method of measurement: 100% of HP's sites provide fully-functioning WASH services to all workers on a daily basis. WASH expectations are outlined in HP's global EHS Policy and audited annually as part of our EHS standards and governance processes
[Fixed row]

(9.2.2) What are the total volumes of water withdrawn, discharged, and consumed across all your operations, how do they compare to the previous reporting year, and how are they forecasted to change?

Total withdrawals

(9.2.2.1) Volume (megaliters/year)

2235

(9.2.2.2) Comparison with previous reporting year

Select from:
☑ About the same

(9.2.2.3) Primary reason for comparison with previous reporting year

Select from:
☑ Other, please specify :Water leak

(9.2.2.4) Five-year forecast

Select from:
☑ Lower

(9.2.2.5) Primary reason for forecast

Select from:

☑ Facility closure

(9.2.2.6) Please explain

In 2023, we withdrew 2,235,000 cubic meters of water overall, 0.4% more than in 2022, due primarily to the addition of Poly sites and an underground leak at our site in Penang, Malaysia. The discovery of this leak led us to implement a more robust water-monitoring plan at the site, including relocating the pipes above ground, allowing for easier monitoring and repair. We anticipate future volumes to slightly decrease due to sites closures and water efficiency projects.

Total discharges

(9.2.2.1) Volume (megaliters/year)

1544

(9.2.2.2) Comparison with previous reporting year

Select from:

☑ About the same

(9.2.2.3) Primary reason for comparison with previous reporting year

Select from:

☑ Other, please specify **:**Water leak

(9.2.2.4) Five-year forecast

Select from:

☑ Lower

(9.2.2.5) Primary reason for forecast

Select from:

☑ Facility closure

(9.2.2.6) Please explain

Total water discharge increased slightly from 1,497 megaliters in 2022 to 1,544 megaliters in 2023 corresponding to a 3.12% change attributable to a water leak at the Penang location. We anticipate future volumes to slightly decrease due to the correction of the leak, sites closures and water efficiency projects.

Total consumption

(9.2.2.1) Volume (megaliters/year)

691

(9.2.2.2) Comparison with previous reporting year

Select from:

☑ About the same

(9.2.2.3) Primary reason for comparison with previous reporting year

Select from:

☑ Other, please specify :Water leak

(9.2.2.4) Five-year forecast

Select from:

☑ Lower

(9.2.2.5) Primary reason for forecast

Select from:

☑ Facility closure

(9.2.2.6) Please explain

HP's total water consumption decreased by 5%, from 730 megaliters in 2022 to 691 megaliters in 2023 across all HP's direct operations. The increase is due primarily to the underground leak at our site in Penang, Malaysia. We anticipate future volumes to slightly decrease due to sites closures and water efficiency projects.
[Fixed row]

(9.2.4) Indicate whether water is withdrawn from areas with water stress, provide the volume, how it compares with the previous reporting year, and how it is forecasted to change.

(9.2.4.1) Withdrawals are from areas with water stress

Select from:

☑ Yes

(9.2.4.2) Volume withdrawn from areas with water stress (megaliters)

282

(9.2.4.3) Comparison with previous reporting year

Select from:

☑ Higher

(9.2.4.4) Primary reason for comparison with previous reporting year

Select from:

☑ Other, please specify **:**The withdraw for areas of stress increase due to the adding of the HP-Poly manufacturing facility in Tijuana, Mexico and due to an increase of the annual adjustment to the intensity factor for the extrapolated sites.

(9.2.4.5) Five-year forecast

12.62

(9.2.4.8) Identification tool

Select all that apply

☑ WRI Aqueduct

(9.2.4.9) Please explain

We use the WRI's Aqueduct Water Risk Atlas tool to assess the risk of sites and prioritize reductions in water-stressed locations. Using this tool, we assessed 216 HP facilities as part of our risk modeling for 2023. Ninety-eight of the facilities assessed (46% of the total) fall within the high or extremely high categories for baseline water stress.55 We withdrew 282,000 cubic meters of water from these locations, representing 13% of our overall water withdrawal. At the 24 of those sites where we directly track data (representing 68% of withdrawal volume from high and extremely high–risk areas), water withdrawal increased by 10,000 cubic meters, a 5.6% increase compared to 2022. At the other 74 sites (where water withdrawal data is extrapolated), the annual adjustment to the intensity factor resulted in a increase of 34,000 cubic meters in our estimated withdrawals year over year. Our water goal includes a commitment to focus on high-risk sites.

[Fixed row]

(9.2.7) Provide total water withdrawal data by source.

Fresh surface water, including rainwater, water from wetlands, rivers, and lakes

(9.2.7.1) Relevance

Select from:

☑ Relevant

(9.2.7.2) Volume (megaliters/year)

2.43

(9.2.7.3) Comparison with previous reporting year

Select from:

☑ Higher

(9.2.7.4) Primary reason for comparison with previous reporting year

Select from:

☑ Other, please specify **:**Rainwater variation YoY

(9.2.7.5) Please explain

HP continues to operate the rainwater capture system at our Singapore site (DRD) - one of HP's largest production sites. The rainwater is utilized for cooling tower make-up water, hence the selection of ‘relevant’. The total volume of rainwater captured from the system is reported at 2.43 megaliters for 2023, which is approximately 15% higher than the volume harvested in 2022, 2.11 megaliters.

Brackish surface water/Seawater

(9.2.7.1) Relevance

Select from:

☑ Not relevant

(9.2.7.5) Please explain

We do not draw water from brackish surface water/seawater, hence the selection of not relevant. HP has no plans to withdraw water from this source. This is consistent with last year and anticipated to be the same next year.

Groundwater – renewable

(9.2.7.1) Relevance

Select from:

☑ Relevant

(9.2.7.2) Volume (megaliters/year)

1.01

(9.2.7.3) Comparison with previous reporting year

Select from:

☑ Much higher

(9.2.7.4) Primary reason for comparison with previous reporting year

Select from:

☑ Increase/decrease in efficiency

(9.2.7.5) Please explain

We primarily use groundwater at HP's site in Guadalajara, Mexico (GUA). In October of 2021, a dewatering well project was completed at our site in Corvallis, OR. These wells help to manage water tables for structural purposes by withdrawing naturally occurring groundwater and repurposing it for irrigation or to return to local surface bodies of water through storm drains. Groundwater withdrawn through dewatering wells at the site is excluded from the water withdrawal amount reported due to the lack of data available to measure or estimate. Note that the groundwater is considered non potable water.

Groundwater – non-renewable

(9.2.7.1) Relevance

Select from:

☑ Not relevant

(9.2.7.5) Please explain

We do not draw water from nonrenewable groundwater, hence the selection of not relevant. HP has no plans to withdraw water from this source. This is consistent with last year and anticipated to be the same next year.

Produced/Entrained water

(9.2.7.1) Relevance

Select from:

☑ Not relevant

(9.2.7.5) Please explain

We do not draw water from produced/process water sources, hence the selection of not relevant. HP has no plans to withdraw water from this source. This is consistent with last year and anticipated to be the same next year.

Third party sources

(9.2.7.1) Relevance

Select from:

☑ Relevant

(9.2.7.2) Volume (megaliters/year)

(9.2.8) Provide total water discharge data by destination.

Fresh surface water

(9.2.8.1) Relevance

Select from:

☑ Relevant

(9.2.8.2) Volume (megaliters/year)

56.96

(9.2.8.3) Comparison with previous reporting year

Select from:

☑ Higher

(9.2.8.4) Primary reason for comparison with previous reporting year

Select from:

☑ Increase/decrease in business activity

(9.2.8.5) Please explain

HP discharges directly to fresh surface water at our Singapore (DRD) facility. Wastewater at this site is discharged to the storm water sewer system, before eventually being discharged to a reservoir. Prior to discharge, the internal water treatment plant monitors and treats for all required substances under Singapore's Sewerage and Drainage (Trade Effluent) Regulations. In 2023, this value was 56.96 megaliters per year, which is 95% higher than the value in 2022. The higher discharge volume is attributable to production activity.

Brackish surface water/seawater

(9.2.8.1) Relevance

Select from:

☑ Not relevant

(9.2.8.5) Please explain

HP does not discharge water to brackish surface water/seawater sources.

Groundwater

(9.2.8.1) Relevance

Select from:

☑ Relevant

(9.2.8.2) Volume (megaliters/year)

534.48

(9.2.8.3) Comparison with previous reporting year

Select from:

☑ Much higher

(9.2.8.4) Primary reason for comparison with previous reporting year

Select from:

☑ Change in accounting methodology

(9.2.8.5) Please explain

HP only discharges to groundwater at our Malaysia (PEN) facility. Wastewater at this site is discharged to the storm water sewer system, before eventually being discharged to groundwater. Prior to discharge, the internal water treatment plant monitors and treats 31 parameters to meet the Standard B local regulations. In 2023, HP discharged 534.48 megaliters of treated wastewater to groundwater sources in 2022. This is a 50% increase compared to 2022, which is attributable to a water leak that occurred in August of 2023 which was fixed in January 2024. We expect this number to decrease in the future as the leak was a one-time event that has been fixed.

Third-party destinations

(9.2.8.1) Relevance

Select from:

☑ Relevant

(9.2.8.2) Volume (megaliters/year)

952.25

(9.2.8.3) Comparison with previous reporting year

Select from:

☑ Lower

(9.2.8.4) Primary reason for comparison with previous reporting year

Select from:

☑ Change in accounting methodology

(9.2.8.5) Please explain

HP mainly discharges to third party sources. All the wastewater noted is Industrial Wastewater that is treated by HP and then discharged to municipal sewers, not directly to any waterways. Permits require dischargers to use the best available treatment technologies dependent on the type of pollutants present in the wastewater to eliminate harmful discharge to the sewage treatment plant. Total discharge was 1,111.77 megaliters in 2022 and 952.25 in 2023 which equates to a 14% decrease. This decrease was primarily due to the annual adjustment to the estimation factor for wastewater, which is based on an average taken from the sites for which we have actual wastewater data. We expect this number to stay about the same or decrease in the future due to continued increases in efficiency and investment in water-smart technologies and processes across our portfolio.
[Fixed row]

(9.2.9) Within your direct operations, indicate the highest level(s) to which you treat your discharge.

Tertiary treatment

(9.2.9.1) Relevance of treatment level to discharge

Select from:

☑ Relevant

(9.2.9.2) Volume (megaliters/year)

☑ About the same

(9.2.9.4) Primary reason for comparison with previous reporting year

Select from:

☑ Other, please specify :Volume being treated about the same as past years

(9.2.9.5) % of your sites/facilities/operations this volume applies to

Select from:

☑ Less than 1%

(9.2.9.6) Please explain

At our Corvallis site, primary treatment occurs upstream of our industrial wastewater (IWW) system to remove heavy metals, and filtration occurs at tools and sinks to limit solid particles. While the COR site has always complied with all applicable local regulations, in FY22 it was the first year that the reporting team became aware of primary treatment to wastewater occurring at the site. The reported volume is an estimate based on an average of 6,000 gallons of water/day being treated for lead, *zinc, and titanium and 250 gallons per day being treated for dissolved gold, with 250 operating days in FY23. This estimate of 5.91 megaliters going through primary treatment is about the same as what we estimated for last year. We anticipate this trend to stay about the same going forward.*

Discharge to the natural environment without treatment

(9.2.9.1) Relevance of treatment level to discharge

Select from:

☑ Not relevant

(9.2.9.6) Please explain

HP does not release discharges to the natural environment without treatment.

Discharge to a third party without treatment

(9.2.9.5) % of your sites/facilities/operations this volume applies to

Select from:

☑ 91-99

(9.2.9.6) Please explain

HP discharges a large portion of its wastewater to 3rd party treatment plants. Most facilities do not require pretreatment before discharge to the 3rd party plants and HP complies with all local permit requirements where applicable. Our overall “discharge to a third party without treatment” volume increased this year at our manufacturing facilities due to increased production. Additionally, this increase was offset by a facility closure as well as water reduction projects.

Other

Select from:

☑ Less than 1%

(9.2.9.6) Please explain

HP acid waste neutralization (pH adjustment) in wastewater pretreatment is required by local permit requirements at our site in Corvallis for the wastewater output form specific pieces of production equipment. After going through acid waste neutralization, the wastewater is discharged to the regional water treatment plant for 3rd party treatment. In 2023, 488.05 megaliters of water were treated for acid waste neutralization at the COR site, vs 678.89 megaliters of water in 2022. The decrease occurred due to downtime for the specified equipment. This figure was calculated by subtracting the water that goes through primary treatment at COR from the total discharge number for the site. The amount that remains is the water that is treated for acid waste neutralization as the highest level of treatment.
[Fixed row]

(9.2.10) Provide details of your organization’s emissions of nitrates, phosphates, pesticides, and other priority substances to water in the reporting year.

(9.2.10.1) Emissions to water in the reporting year (metric tons)

2.72

(9.2.10.2) Categories of substances included

Select all that apply
☑ Priority substances listed under the EU Water Framework Directive

(9.2.10.3) List the specific substances included

Lead Nickel Cadmium Mercury

(9.2.10.4) Please explain

HP monitors the quality of discharge emissions to water at 100% of sites where this monitoring is required based on local permit requirements. HP discharges to the storm water sewer system at our facilities in Malaysia (PEN) and Singapore (DRD), before that water is eventually discharged to groundwater, or a reservoir (respectively). Prior to discharge, the internal water treatment plants at these sites monitor and treat for all substances as required by local regulations. At PEN, we conduct monthly monitoring for 31 parameters to meet the Standard B local regulations. Among these 31 parameters, the following priority substances are monitored: Lead, Nickel, Cadmium, and Mercury. At DRD, we adhere to Singapore’s Sewerage and Drainage (Trade Effluent) Regulations, and similarly conduct monthly

monitoring for all required substances, including priority substances such as Nickel, prior to discharge. Additionally, at our facility in Corvallis (COR), primary treatment of industrial wastewater occurs to remove heavy metals and solid particles. Priority substances Nickel, Cadmium, and Lead are monitored and treated. After primary treatment and pH neutralization, industrial wastewater is sent to the City of Corvallis for secondary and tertiary treatment of wastewater.
[Fixed row]

(9.3) In your direct operations and upstream value chain, what is the number of facilities where you have identified substantive water-related dependencies, impacts, risks, and opportunities?

Direct operations

(9.3.1) Identification of facilities in the value chain stage

Select from:

☑ Yes, we have assessed this value chain stage and identified facilities with water-related dependencies, impacts, risks, and opportunities

(9.3.2) Total number of facilities identified

2

(9.3.3) % of facilities in direct operations that this represents

Select from:

☑ Less than 1%

(9.3.4) Please explain

We have identified our facility in Penang, Malaysia (PEN) as being exposed to water risks that have the potential to have financial or strategic impact on our company. While these risks are not substantive as defined by our ERM framework, they are relevant and important for us to understand so that we may plan for the future and reduce risk where possible. We have identified our facility in Barcelona, Spain (BCN) as being exposed to water risks that have the potential to have operational impact on our company. While these risks are not substantive as defined by our ERM framework, they are relevant and important for us to understand so that we may plan for the future and reduce risk where possible. The area of Barcelona (Catalonia) experienced the worst drought in History in terms of extent, durations and intensity and due to this different local municipalities have put in place different measures to reduce water consumption. HP is committed to continuing to comply with savings measures proposed in the "Water management Plan" that include specific actions in situations of alert and any future legislation and guidelines established by public administrations to guarantee a responsible user of the water and preserve these vital resources. We are committed to implementing all the measures necessary to fulfill both of these objectives, taking concrete actions to reduce water consumption and improve efficiency in our facilities.

Upstream value chain

(9.3.1) Identification of facilities in the value chain stage

Select from:

☑ Yes, we have assessed this value chain stage and identified facilities with water-related dependencies, impacts, risks, and opportunities

(9.3.2) Total number of facilities identified

38

(9.3.4) Please explain

HP identifies suppliers with substantive impact on water security through production procurement spend, geographic location of facilities, industry/commodities (dependence on water), and water use intensity. Supplier impact on water quality, provision of WASH services, and other water-related topics are assessed through HP's supply chain assurance/audit process. Suppliers in our top 95% of procurement spend are cross-referenced for geographic water risk using WRI Aqueduct and WWF's Water Risk Filter for water risk "high" or greater. The threshold for suppliers' water dependency is based on an HP's internal analysis of highly water dependence for type of product/commodity manufactured and the threshold for impact on water availability is based on internal analysis of suppliers' water intensity reported to HP through response to our CDP Supply Chain Water Security request. Supplier impact on water quality and provision of WASH services is shown through conformance to HP's Supplier CoC.

(9.3.2) For the facilities in your direct operations referenced in 9.3.1, what proportion of water accounting data has been third party verified?

Water withdrawals – total volumes

(9.3.2.1) % verified

Select from:

☑ 76-100

(9.3.2.2) Verification standard used

HP’s Water Accounting Manual (http://h20195.www2.hp.com/V2/GetDocument.aspx?docnamec05179526) details our approach and methodology to calculating our water withdrawal and consumption. The review of direct water withdrawal data by the independent accountant firm, EY, was conducted in accordance with attestation standards established by the American Institute of Certified Public Accountants (AICPA) in AT-C section 105 and AT-C section 210. See the HP 2023 Sustainable Impact Report, pp. 189-191 online at https://h20195.www2.hp.com/V2/getpdf.aspx/c05179523.pdf

Water withdrawals – volume by source

(9.3.2.1) % verified

Select from:

☑ 76-100

(9.3.2.2) Verification standard used

HP's Water Accounting Manual (http://h20195.www2.hp.com/V2/GetDocument.aspx?docnamec05179526) details our approach and methodology to calculating our water withdrawal and consumption. The review of direct water withdrawal data by the independent accountant firm, EY, was conducted in accordance with attestation standards established by the American Institute of Certified Public Accountants (AICPA) in AT-C section 105 and AT-C section 210. See the HP 2023 Sustainable Impact Report, pp. 189-191 online at https://h20195.www2.hp.com/V2/getpdf.aspx/c05179523.pdf

Water withdrawals – quality by standard water quality parameters

(9.3.2.1) % verified

Select from:

☑ Not relevant

(9.3.2.3) Please explain

The majority of HP's water withdrawals come from municipal water utility suppliers. These suppliers are responsible for water quality monitoring to ensure they provide customers with the level of water quality that complies with local requirements. We measure water withdrawal quality if there is an identified need to measure by our EHS team. HP conducts business in a manner that delivers leading environmental, health, and safety performance consistent with commitment to HP EHS Standards for Air and Water, and that we meet or exceed all applicable legal requirements, local codes, and regulations.

Water discharges – total volumes

(9.3.2.1) % verified

Select from:

☑ 76-100

(9.3.2.2) Verification standard used

Water discharge volume is monitored and verified by an independent third party to ensure that HP conducts business in a manner that delivers leading environmental, health, and safety performance consistent with our commitment to HP EHS Standards for Air and Water, and that we meet or exceed all applicable legal requirements, local codes, and regulations. For example, HP sites in Singapore comply with the Sewerage and Drainage Act 2012 and Sewerage and Drainage (Trade Effluent) Regulations 2016.

Water discharges – volume by destination

(9.3.2.1) % verified

Select from:

☑ 76-100

(9.3.2.2) Verification standard used

Water discharge volume by destination is monitored and verified by an independent third party to ensure that HP conducts business in a manner that delivers leading environmental, health and safety performance consistent with commitment to HP EHS Standards for Air and Water, and that we meet or exceed all applicable legal requirements, local codes and regulations. For example, HP sites in Singapore comply with the Sewerage and Drainage Act 2012 and Sewerage and Drainage Regulations 2016.

Water discharges – volume by final treatment level

(9.3.2.1) % verified

Select from:

☑ 76-100

(9.3.2.2) Verification standard used

Water discharge volume by treatment method is monitored and verified by an independent third party to ensure that HP conducts business in a manner that delivers leading environmental, health and safety performance consistent with commitment to HP EHS Standards for Air and Water, and that we meet or exceed all applicable legal requirements, local codes, and regulations. For example, HP sites in Singapore comply with the Sewerage and Drainage Act 2012 and Sewerage and Drainage Regulations 2016.

Water discharges – quality by standard water quality parameters

(9.3.2.1) % verified

Select from:

☑ 76-100

(9.3.2.2) Verification standard used

Water discharge quality by effluent parameters is monitored and verified by an independent third party to ensure that HP conducts business in a manner that delivers leading environmental, health and safety performance consistent with commitment to HP EHS Standards for Air and Water, and that we meet or exceed all applicable *legal requirements, local codes, and regulations. For example, HP sites in Singapore comply with the Sewerage and Drainage Act 2012 and Sewerage and Drainage Regulations 2016.*

Water consumption – total volume

(9.3.2.1) % verified

Select from:

☑ 76-100

(9.3.2.2) Verification standard used

HP's Water Accounting Manual (http://h20195.www2.hp.com/V2/GetDocument.aspx?docnamec05179526) details our approach and methodology to calculating our water withdrawal and consumption. The review of direct water withdrawal data by the independent accountant firm, EY, was conducted in accordance with attestation standards established by the American Institute of Certified Public Accountants (AICPA) in AT-C section 105 and AT-C section 210. [Fixed row]

(9.4) Could any of your facilities reported in 9.3.1 have an impact on a requesting CDP supply chain member?

Select from:

☑ We do not have this data but we intend to collect it within two years

(9.5) Provide a figure for your organization's total water withdrawal efficiency.

(9.5.1) Revenue (currency)

53718000000

(9.5.2) Total water withdrawal efficiency

24034899.33

(9.5.3) Anticipated forward trend

HP expects water withdrawal efficiency to increase going forward. In FY23, HP exceeded its goal of reducing potable water withdrawal in global operations by 35% by 2025 (2015 baseline), focusing on large and high risk (i.e. water stressed) sites as defined by HP's annual water risk assessments. We are now developing a new quantitative goal, while maintaining our focus on high-risk sites.
[Fixed row]

(9.13) Do any of your products contain substances classified as hazardous by a regulatory authority?

	Products contain hazardous substances
	Select from: ☑ Yes

[Fixed row]

(9.13.1) What percentage of your company's revenue is associated with products containing substances classified as hazardous by a regulatory authority?

Row 1

(9.13.1.1) Regulatory classification of hazardous substances

Select from:
☑ Candidate List of Substances of Very High Concern for Authorisation above 0.1% by weight (EU Regulation)

(9.13.1.2) % of revenue associated with products containing substances in this list

Select from:
☑ More than 80%

(9.13.1.3) Please explain

100% of HP products may contain small amounts of some chemicals on the IEC 62474 Declarable Substance List. HP is committed to meeting all legal and regulatory requirements, and has gone beyond these requirements to proactively restrict substances of concern. Any remaining uses of substances of concern in products are for applications that lack viable alternatives. All electronics companies still have products claiming Restriction of Hazardous Substances Directive (RoHS) exemptions or using Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH) regulation candidate list substances when there is no viable alternative. For example, 100% of electronics products still contain some amount of lead used in specialized applications that are allowed under RoHS exemptions. See HP’s REACH Article 33 Declarations (https://h20195.www2.hp.com/v2/library.aspx?doctype91&footer88&filter_doctypeno&showregionfacetyes&filter_countryno&ccus&lcen&filter_oidno&filter_prodtyperw&prodtypeij&showproductcompatibilityyes&showregionyes&showreglangcolyes&showdesc riptionyes%23doctype-91&sortorder-popular&teasers-off&isRetiredfalse&isRHParentNode-false&titleCheck-false#doctype-91&sortorder-popular&teasersoff&isRetired-false&isRHParentNode-false&titleCheck-false) and the Substances and Materials Requirements (HP Standard 011-01) in the HP General Specification for the Environment for more detail. (https://h20195.www2.hp.com/v2/GetDocument.aspx?docnamec04932490)

[Add row]

(9.14) Do you classify any of your current products and/or services as low water impact?

(9.14.1) Products and/or services classified as low water impact

Select from:

☑ Yes

(9.14.2) Definition used to classify low water impact

ENERGY STAR certified computers and printers deliver substantial savings in energy resulting cost and GHG emissions compared to standard models. A product's energy efficiency must perform in the top 25% for its category to be eligible for ENERGY STAR, a joint program of the Environmental Protection Agency (EPA) and the Department of Energy (DOE). While these ecolabels do not themselves have product related water criteria, their energy efficiency attribute means they reduce the indirect water impacts associated.

(9.14.4) Please explain

Given the importance of energy efficiency to our customers and HP's own climate strategy and product stewardship, a high percentage of the products we ship each year are ENERGY STAR qualified: 90% of HP personal systems models and 87% of printing models shipped in 2023.

[Fixed row]

(9.15) Do you have any water-related targets?

Select from:
☑ Yes

(9.15.2.11) % of target achieved relative to base year

87

(9.15.2.12) Global environmental treaties/initiatives/ frameworks aligned with or supported by this target

Select all that apply

☑ Sustainable Development Goal 6

(9.15.2.13) Explain target coverage and identify any exclusions

HP has a companywide goal to reduce potable water withdrawal of its global operations by 35% by 2025 compared to a 2015 baseline, focusing on high-risk sites as identified in WRI tool. This goal intends to improve water security for HP and surrounding communities by reducing our withdrawal and reliance on potable water resources, especially in areas of high-water stress. Global operations exclude independent subsidiaries.

(9.15.2.14) Plan for achieving target, and progress made to the end of the reporting year

We will continue to employ sustainable landscaping, infrastructure upgrades, leak monitoring and detection, and graywater reuse and we will evaluate our dependency on potable water by utilizing alternative sources, including rainwater and reclaimed water. In FY23 we achieved a 38% reduction since 2015, meeting our goal (as in 2022), despite adding 59 Poly sites to our portfolio.

(9.15.2.16) Further details of target

In 2019, HP set a new goal to reduce potable water withdrawal of its global operations by 35% by 2025 against a 2015 baseline, focusing on high-risk sites. This goal expanded upon the success of reaching our previous goal of 15% reduction, which was met in 2019. In 2023, HP withdrew 1,999,430 cubic meters of potable water across global operations, 38% less than in 2015, while continuing to make progress on risk reduction. We are now developing a new quantitative goal, while maintaining our focus on high-risk sites. To decrease and recycle water used at our facilities, we employ sustainable landscaping, infrastructure upgrades, leak monitoring and detection, and greywater reuse. At some locations, we also reduce our dependency on potable water by utilizing alternative sources, including rainwater and reclaimed water.

General standards

☑ Attestation Standards (AT-C Section 105 & 210/205) established by the American Institute of Certified Public Accountants (AICPA)

(13.1.1.4) Further details of the third-party verification/assurance process

Total water withdrawal presented as the total of surface water, ground water and third-party water as defined within and by HP management definitions disclosed in the 2023 Sustainable Impact Report. Direct water withdrawal for HP operations includes water withdrawn for use in operations or facilities within HP's operational control and includes: 2,000 cubic meters of captured rain water (classified as surface water); 1,000 cubic meters of well water (classified as ground water); and 2,232,000 cubic meters of municipal water and NeWater, which is wastewater sourced from another organization (both of which are classified as third-party water). Note that sewage treatment plant (STP) water is not included within the scope of water withdrawal. Seawater and produced water are not applicable to HP. De-watering wells are present at HP's Corvallis, OR site to manage water tables for structural purposes by withdrawing naturally occurring groundwater and repurpose for irrigation or to return to local surface bodies of water through storm drains. Groundwater withdrawn through de-watering wells at the site is excluded from the water withdrawal amount reported due to the lack of data available to measure or estimate. Note that the groundwater is considered non-potable water.

(13.1.1.5) Attach verification/assurance evidence/report (optional)
